## Outline

- operational set-up and member generation of COSMO-DE-EPS
- case study
- verification results
- broad over view of next steps (status and plans, more details in WG 7 parallel session)

## Operational set-up of COSMO-DE-EPS

**operational set-up:**

- 20 members
- grid size: 2.8 km  
*convection-permitting*
- lead time: 0-21 hours,  
8 starts per day (00, 03, 06,... UTC)

model domain

### Perturbation Methods

Peralta, C., Ben Bouallègue, Z., Theis, S.E., Gebhardt, C. and M. Buchhold, 2012: Accounting for **initial condition uncertainties** in COSMO-DE-EPS. Journal of Geophysical Research, VOL. 117, D07108, doi:10.1029/2011JD016581, 2012

Gebhardt, C., Theis, S.E., Paulat, M. and Z. Ben Bouallègue, 2011: Uncertainties in COSMO-DE precipitation forecasts introduced by **model perturbations and variation of lateral boundaries**. Atmospheric Research 100, 168-177. (*contains status of 2009*)

Peralta, C. and M. Buchhold, 2011: **Initial condition perturbations** for the COSMO-DE-EPS, COSMO Newsletter 11, 115–123.

## COSMO-DE-EPS Overview **COSMO GM 2011**

- start of pre-operational phase / evaluation
  - 20 members → probabilities, quantiles, etc
  - runs at 00 UTC, 03 UTC, 06 UTC,...
  
- start of pre-operational phase with **40 ensemble** members
  
- reach operational status
  
- ...

End of 2012

2013

## Main results from pre-operational phase (20 members)

- **evaluation** by forecasters (case studies):
  - additional benefit for precipitation forecasts
  - provides **early signals for severe weather**
  - most beneficial for **convective precipitation** in summer
  - drawback: jumpiness between consecutive runs
  
- **probabilistic verification** (for periods of several months)
  - probabilities perform better than deterministic “yes/no”
  - particularly for **high precipitation thresholds**
  - particularly for **longer lead times**
  - drawback: underdispersiveness (esp. for wind gusts and T\_2M)

**observations: SYNOP**

## rank histogram

## COSMO-DE-EPS status and plans

→ start of pre-operational mode (9th Dec 2010)

→ undergoing evaluation by forecasters  
(EPS quality and visualization by NinJo)

———— switch to operational mode ————  
(22nd May 2012)

→ upgrade to 40 members, redesign

## upgrade to 40 members, redesign

- use of COSMO-LEPS members as boundary conditions  
(COSMO-LEPS is driven by IFS EPS of ECMWF)

*slight improvements for precip.,  
degradation of 2m temperature results*

- perturbation of soil moisture

*better results for 2m temperature, slight improvements for precip.*

- additional physics perturbations (minimum diffusion,  $z_0$ )

*better results for 2m temperature,  
slight improvement for wind gusts*

## COSMO-DE-EPS status and plans

→ start of pre-operational mode (9th Dec 2010)

→ undergoing evaluation by forecasters  
(EPS quality and visualization by NinJo)

———— switch to operational mode ————  
(22nd May 2012)

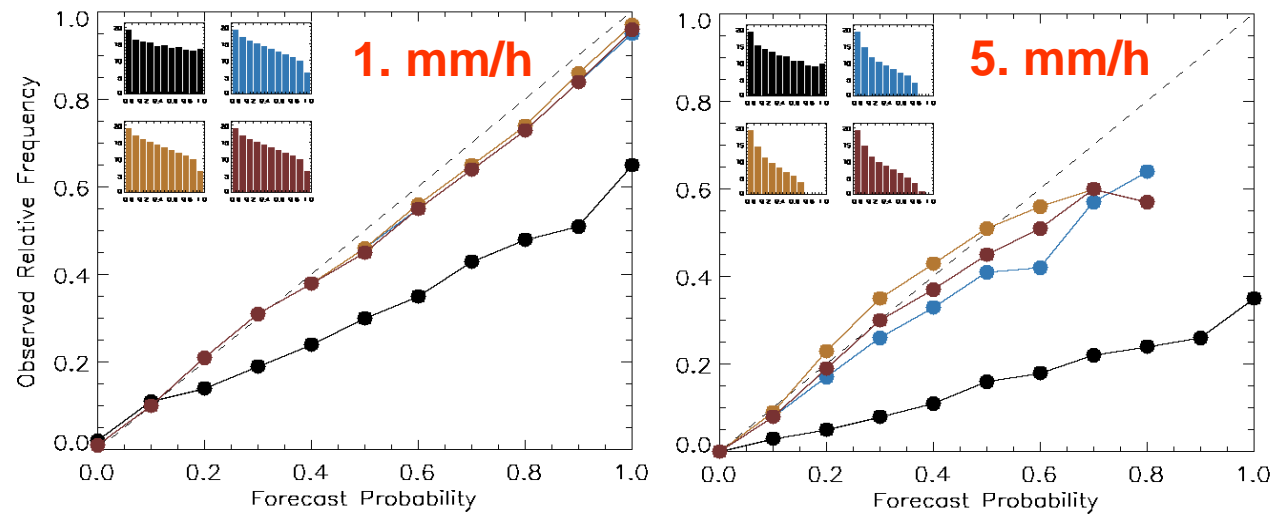

→ upgrade to 40 members, redesign

→ statistical postprocessing

- Non calibrated
- Calibrated with standard logistic regression
- Calibrated with extended logistic regression
- Calibrated with extended logistic regression (2<sup>nd</sup> linearization)

## COSMO-DE-EPS status and plans

→ start of pre-operational mode (9th Dec 2010)

→ undergoing evaluation by forecasters  
(EPS quality and visualization by NinJo)

———— switch to operational mode ————  
(22nd May 2012)

→ upgrade to 40 members, redesign

→ statistical postprocessing

→ lagged average forecast

## COSMO-DE-EPS status and plans

→ start of pre-operational mode (9th Dec 2010)

→ undergoing evaluation by forecasters  
(EPS quality and visualization by NinJo)

———— switch to operational mode ————  
(22nd May 2012)

→ upgrade to 40 members, redesign

→ statistical postprocessing

→ lagged average forecast

→ initial conditions by LETKF (“KENDA”)

→ lateral boundary conditions by ICON EPS
