# KENDA at MeteoSwiss

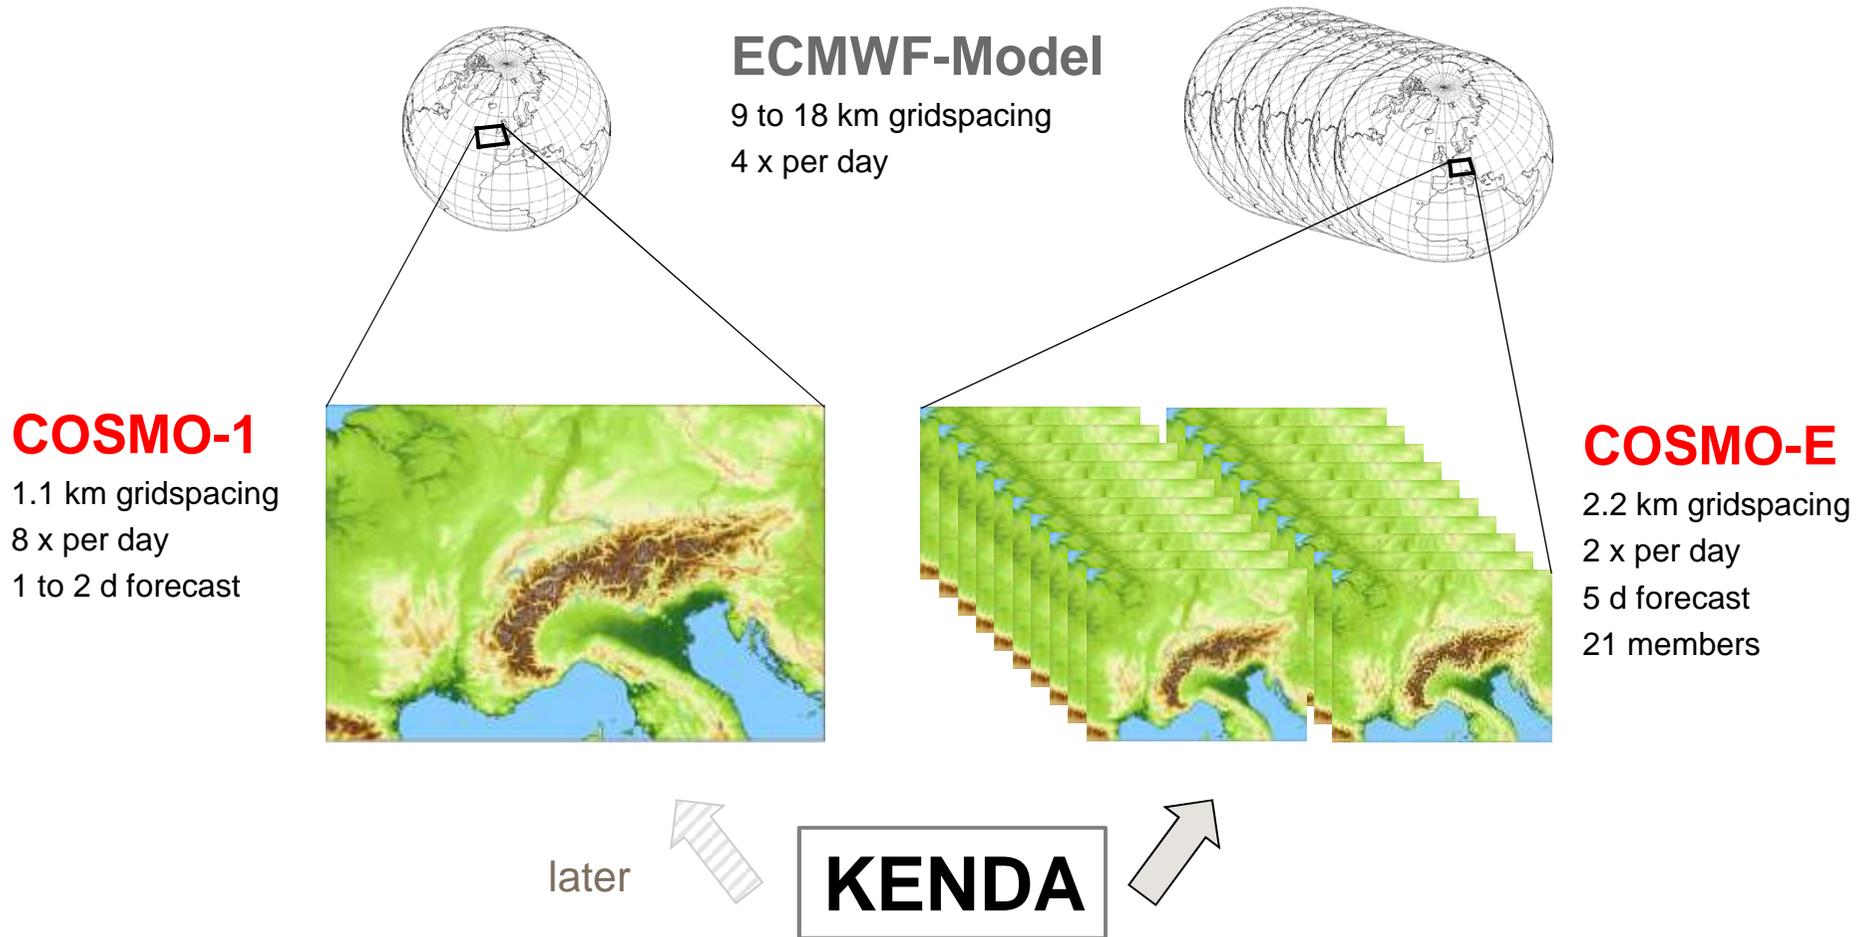

## Operational implementation and results

Daniel Leuenberger and the COSMO-NExT team  
MeteoSwiss, Zürich, Switzerland

COSMO General Meeting, 5.– 8. September 2016

# COSMO-NExT

# Operational KENDA Implementation

- General
  - 40 ensemble members, additional deterministic analysis
  - Hourly cycle
  - LBC perturbations from 30-42h old ECMWF ENS perturbations centered around the latest HRES forecast
- LETKF
  - Adaptive localization
  - Adaptive multiplicative covariance inflation
  - Relaxation to prior perturbations (RTTP)

# Operational KENDA Implementation

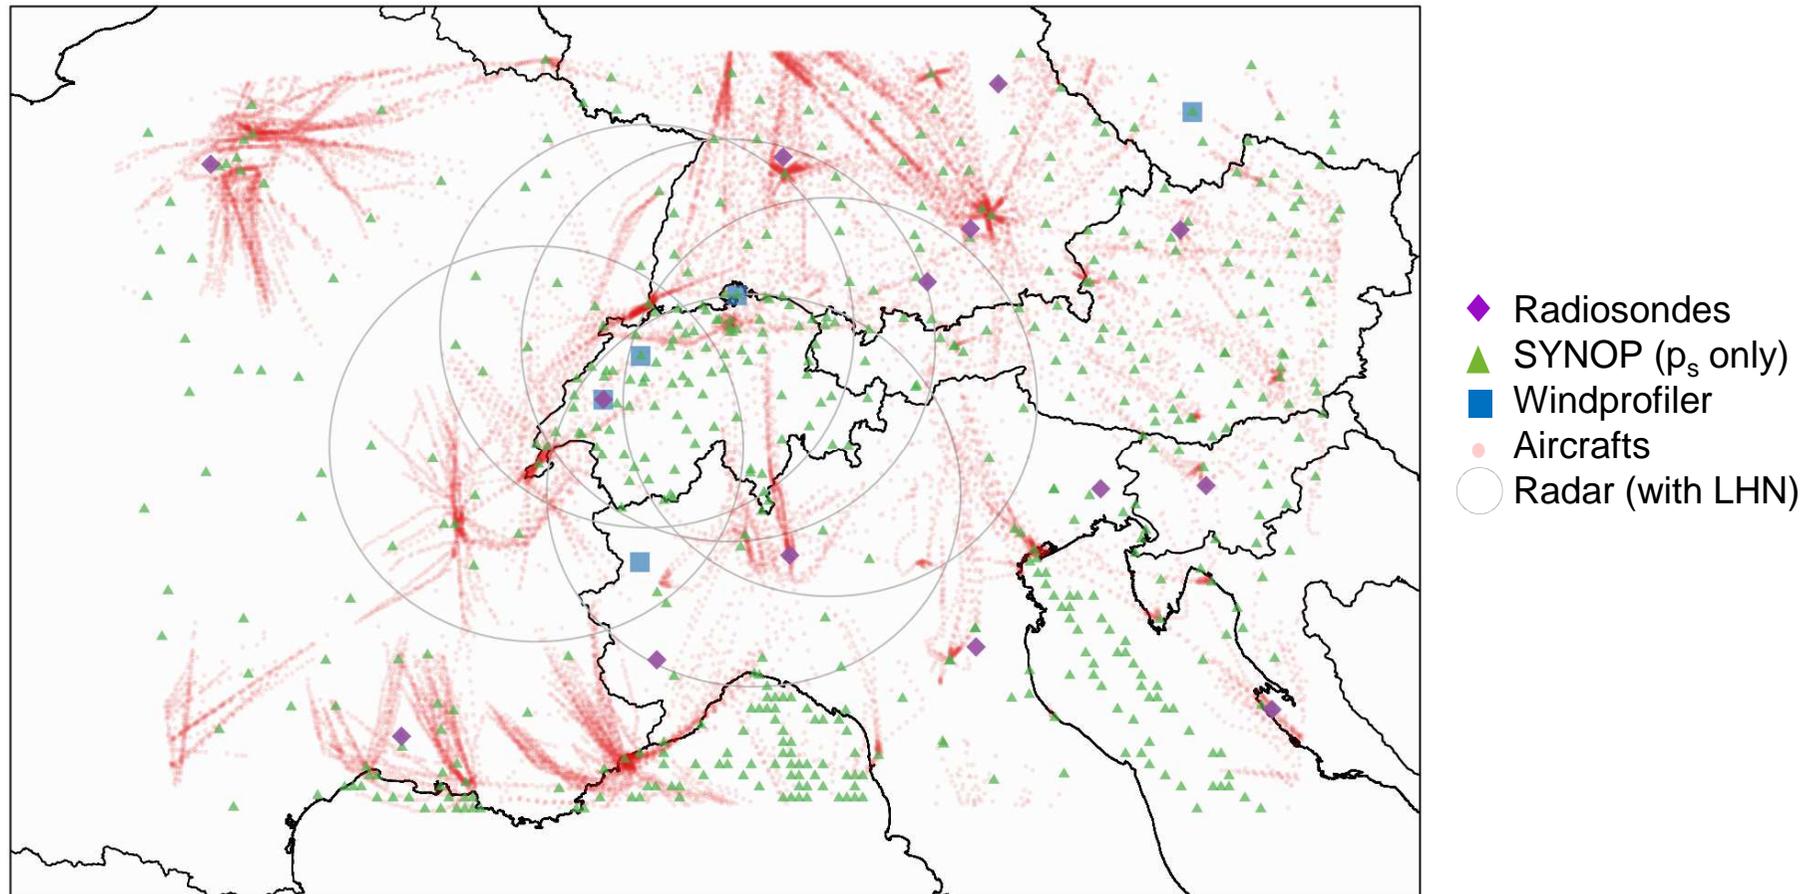

- Additionally
  - LHN in every ensemble member
  - Snow analysis for each ensemble member once per day
- Runtime for one cycle

<b>Component</b>	<b>Run Time</b>	<b># of GPU</b>	<b># of CPU cores</b>
COSMO (fc step)	6.0 min	176	176
LETKF (update step)	2.5 min	--	264

# Observations

Location of observations collected during one month

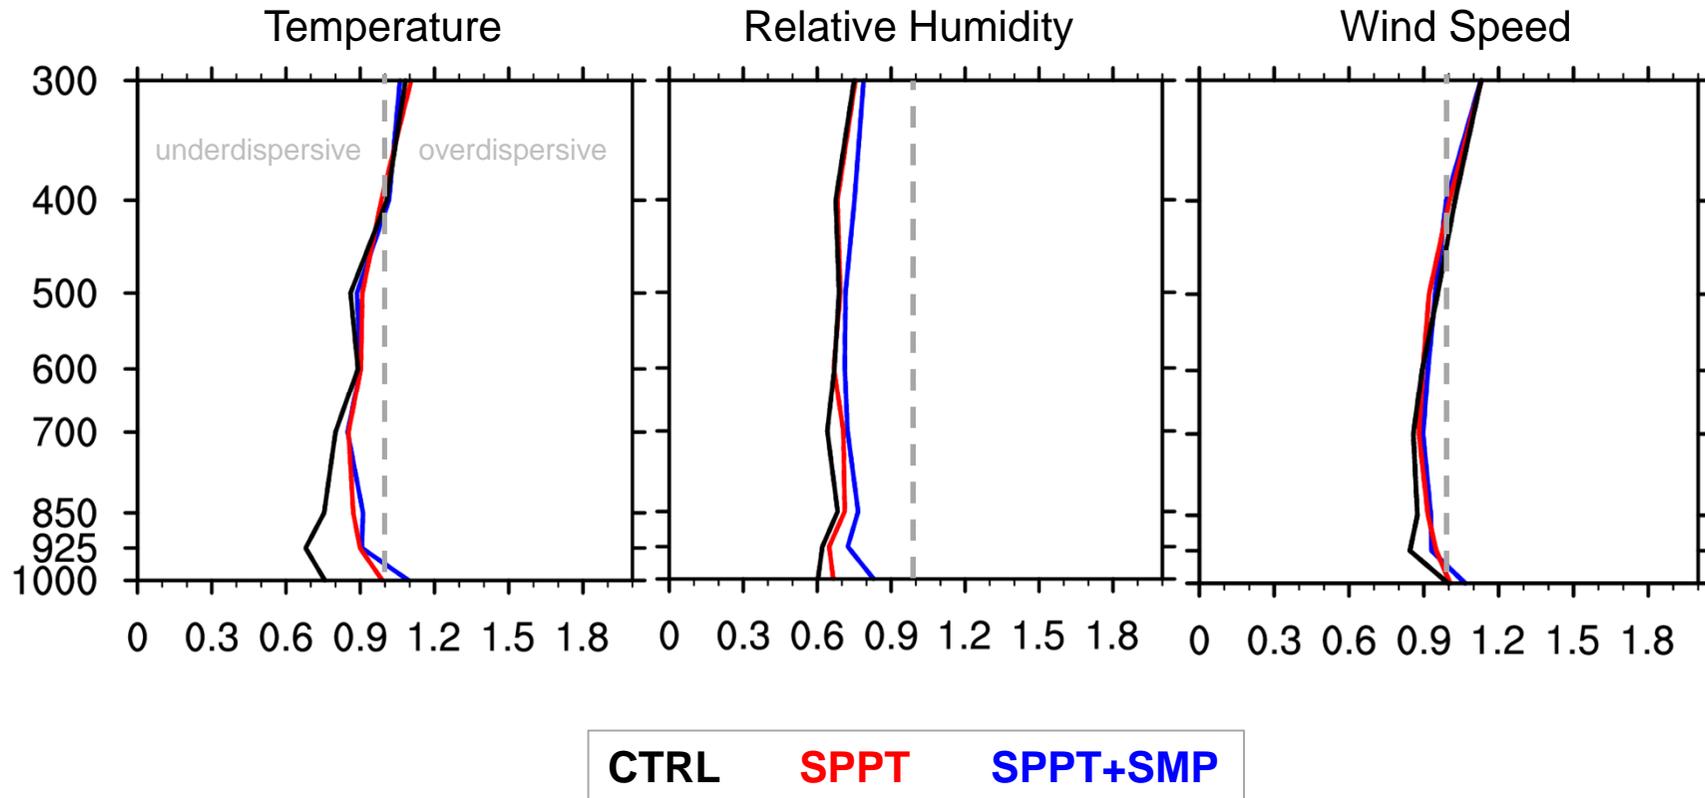

# Additional Perturbations

- LETKF assumes bias-free model
- As this is far from true, use ad-hoc ways to account for model error (covariance inflation, RTTP)
- Spread is **still too small**, use **more perturbations**:
  - Stochastic Perturbations of Physical Tendencies (**SPPT**)
  - Soil moisture perturbations (**SMP**)

# Analysis Performance

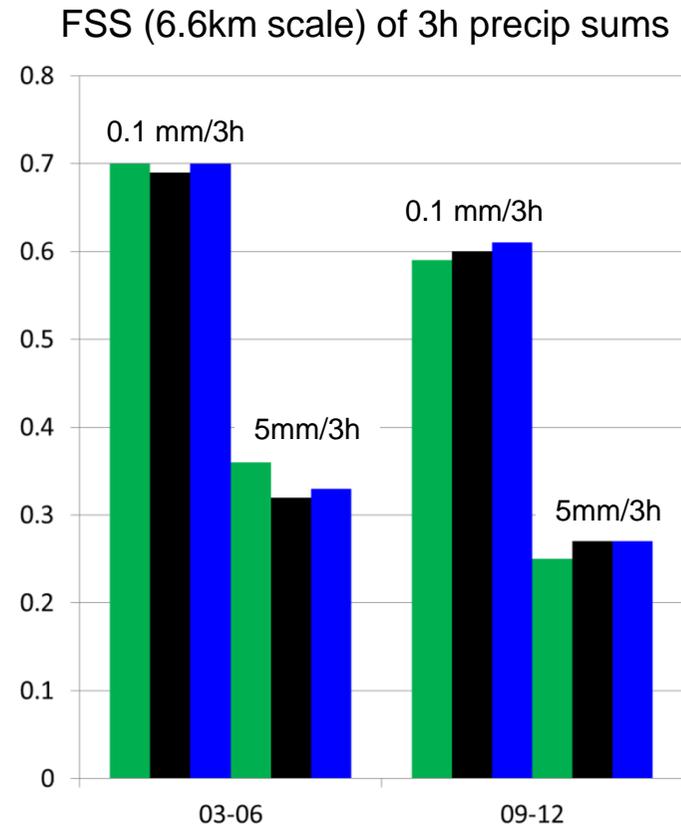

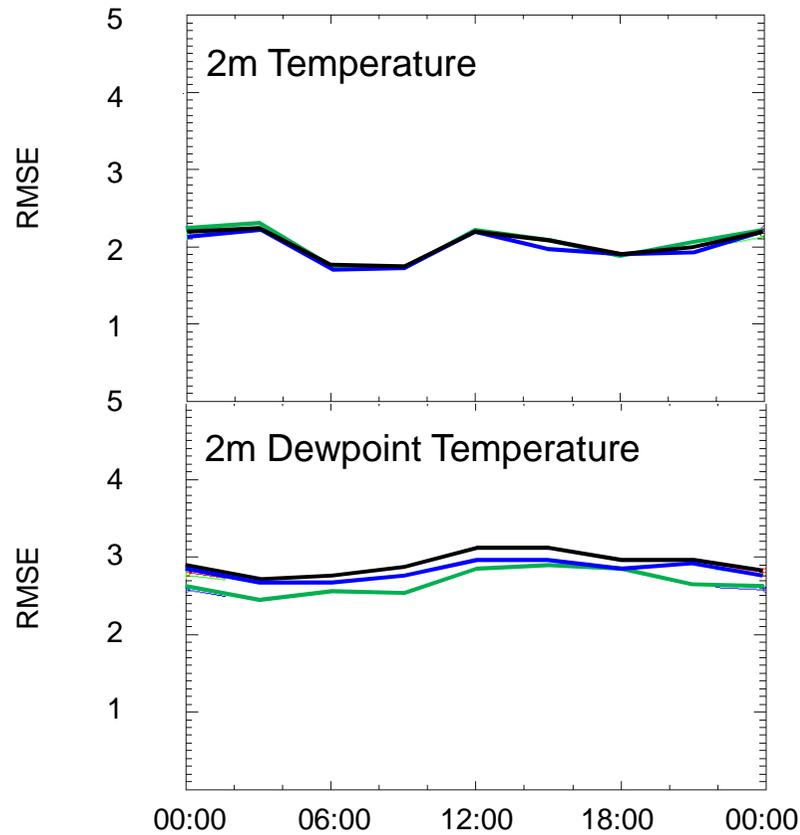

First guess spread-RMSE ratio, verification period: 17.7.-28.8.2015

# Comparison with Nudging

Lead time 1-12h, verification period: 17.7.-28.8.2015

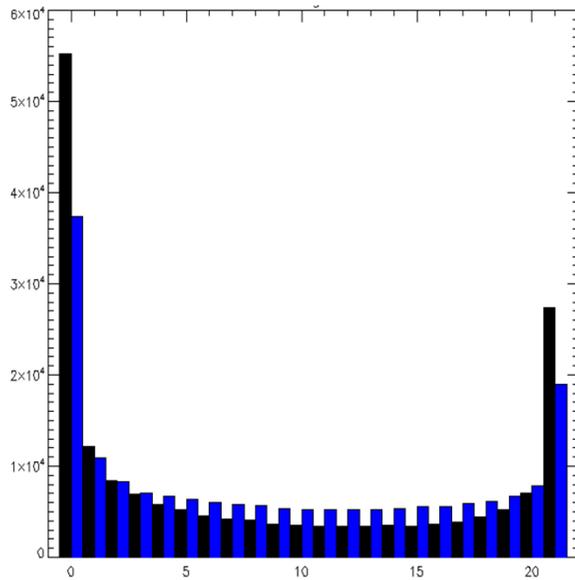

**CTRL**      **SPPT+SMP**      **Nudging**

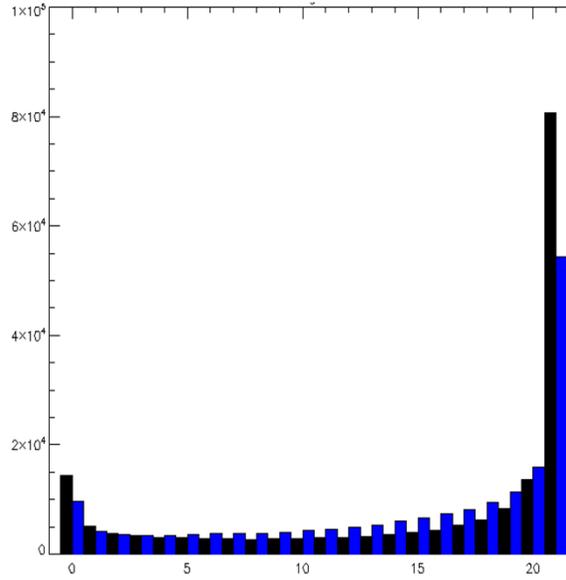

# Benefit of additional Perturbations

Lead time 1-12h, verification period: 17.7.-28.8.2015

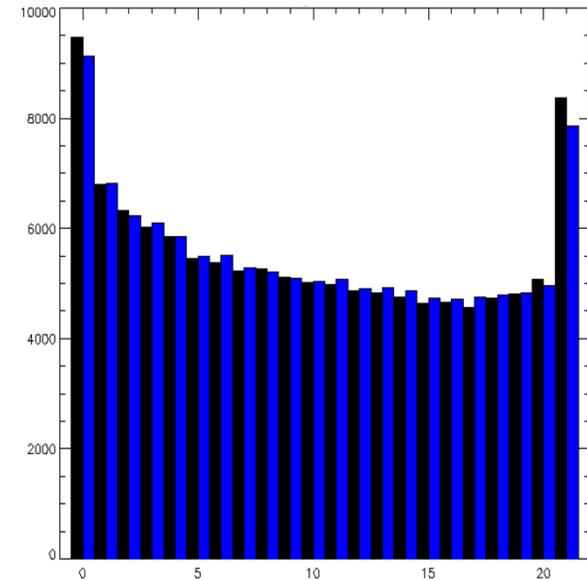

2m Temperature

2m Dewpoint Temperature

Precipitation

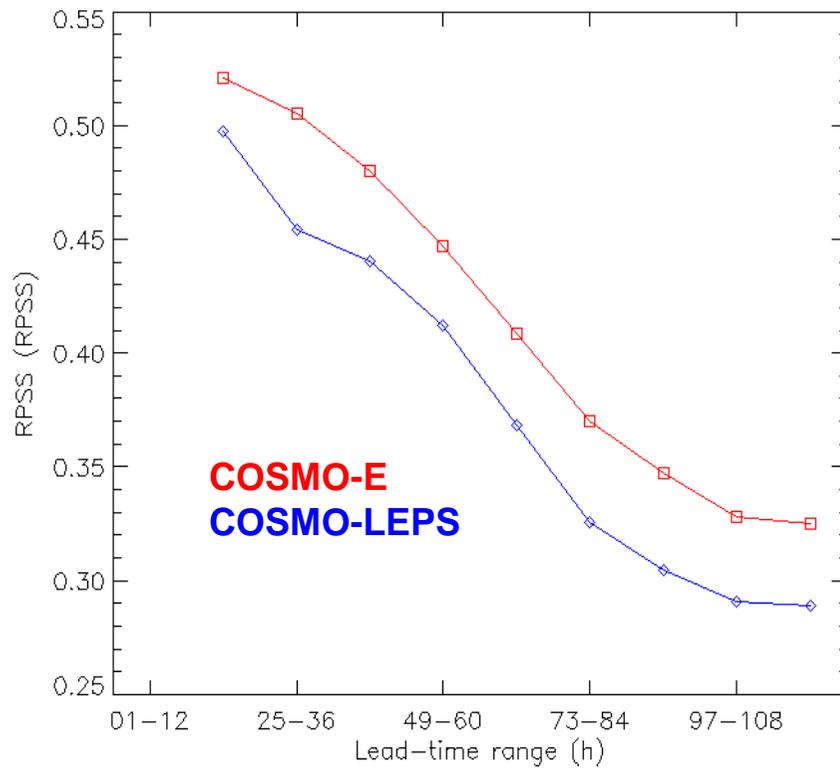

**CTRL**      **SPPT+SMP**

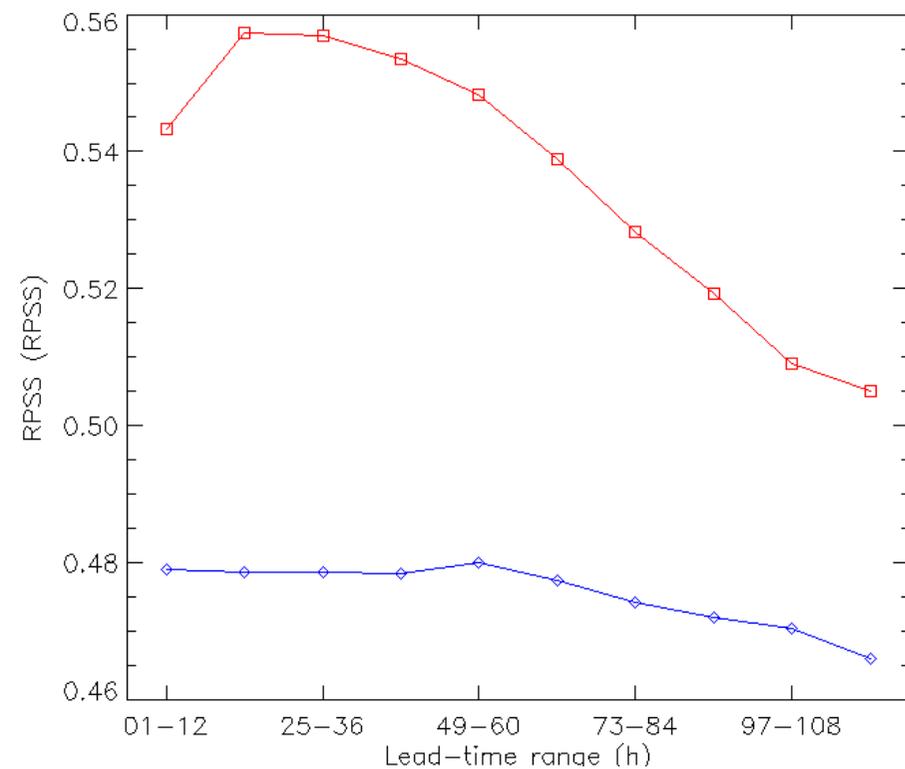

# COSMO-E outperforms COSMO-LEPS

RPSS of 12h precipitation sum and T<sub>2M</sub>, verification period: MAM 2016

Precipitation

2m Temperature

# Summary

- COSMO-E and KENDA operational since 19th March 2016
- COSMO-E outperforms COSMO-LEPS in most variables and seasons, out to +120h!
- KENDA deterministic analyses and forecasts similar to Nudging analyses and forecasts
- KENDA still slightly worse than nudging for summer TD\_2m and precipitation
- SPPT and Soil Moisture Perturbations consistently improve KENDA and forecasts started therefrom, benefit larger in Summer than in Winter period

# Outlook

- Assimilation of T\_2M and TD\_2M
- Deterministic analysis with  $\Delta x=1.1\text{km}$
- Assimilation of MODE-S observations
- Assimilation of more remote-sensing observations (Radar, Lidar, Radiometer, Satellites)

## Thanks...

- ... **to DWD**: Andreas Rhodin, Christoph Schraff, Harald Anlauf, Hendrik Reich, and Roland Potthast
- ... **to the COSMO-NExT team**: André Walser, Guy de Morsier, Jean-Marie Bettems, Marco Arpagaus, Oliver Fuhrer, Petra Baumann, Philippe Steiner, Pirmin Kaufmann, Simon Förster, Xavier Lapillonne, and Yann Lepoittevin
- ... **for your attention!**

# Analysis Performance

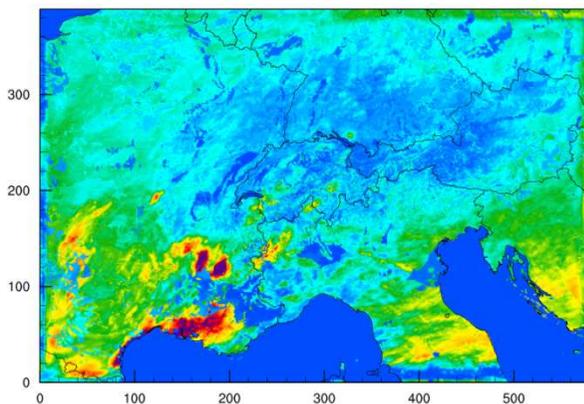

## RMSE of Analysis and First Guess

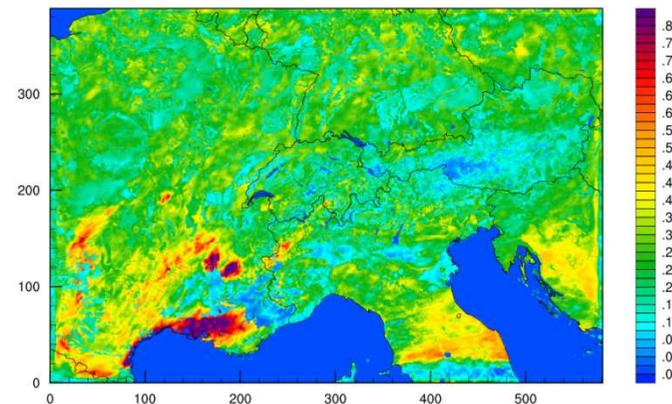

# Additional Perturbations

- LETKF assumes bias-free model.
- As this is far from true, use ad-hoc ways to account for model error (covariance inflation, RTTP)
- Spread is still too small, use more perturbations:
  - Stochastic Perturbations of physical tendencies (SPPT)
  - Soil moisture perturbations
  - Increase in soil moisture spread by ca 80%
