

# Feedback File Based Verification at DWD -recent developments-

- I. Recap of Rfdbk concept**
- II. Recent developments within Rfdbk**
- III. Recap of verification concept**
- IV. Recent progress in verification based on feedback files**
- V. Future plans**

# I. Recap on Rfdbk Concept

- Feedback files are produced during DA and contain observations, analysis and past forecast and lots of meta information valuable for observation based verification tasks
- Using feedback files for the verification means a huge reduction in workload as much of the tedious data preparation tasks are done within DA
- Rfdbk (source on <https://github.com/rxf/Rfdbk>) is a R interface for COSMO feedback files
- Main purpose of Rfdbk is to load feedback file content with R
- Additional functionality useful for verification is implemented as well
- As guideline a set of verification scripts (used at DWD) can be obtained via [https://github.com/rxf/fdbk\\_verification](https://github.com/rxf/fdbk_verification)

# I. Recap on Rfdbk Concept

## The idea behind Rfdbk

- Feedback file information is transformed into data table (each information related to a observation can be a table column) using R data.table package (<https://cran.r-project.org/web/packages/data.table>)
- data.table allows to perform operations on huge tables very quickly with elegant syntax

# DT[i,j,by]

i : where (address only a set of rows)

j : select (address only a set of columns, column names can be used as input for R functions)

by : group (group results by instances of variables in columns)

# I. Recap on Rfdbk Concept

```
> DT
  obs      veri_data      veri_forecast_time
1: 291.65    291.3145                0
2: 292.15    292.2571                0
3: 293.65    292.7871                0
4: 293.25    291.4255                0
5: 301.45    300.2931                0
---
172796: 266.45    266.2054            18000
172797: 269.55    268.9154            18000
172798: 272.05    271.6369            18000
172799: 271.65    271.7378            18000
172800: 273.65    271.7899            18000
> DT[,list(BIAS=mean(veri_data-obs)),by="veri_forecast_time"]

veri_forecast_time      BIAS
1:                   0    0.20529260
2:                  600    0.07754623
3:                 1200    0.14901599
---
```

# I. Recap on Rfdbk Concept

## The idea behind Rfdbk

- Feedback file information is transformed into data table (each information related to a observation can be a table column) using R data.table package (<https://cran.r-project.org/web/packages/data.table/>)
- data.table allows to perform operations on huge tables very quickly with elegant syntax

# DT[i,j,by]

i : where (address only a set of rows)

j : select (address only a set of columns, column names can be used as input for R functions)

by : group (group results by instances of variables in columns)

- Based on data.tables not only scores can be calculated but also a data adjustment between experiments or conditions could be implemented
- data.table is used extensively not only in Rfdbk but also in the DWD verification scripts

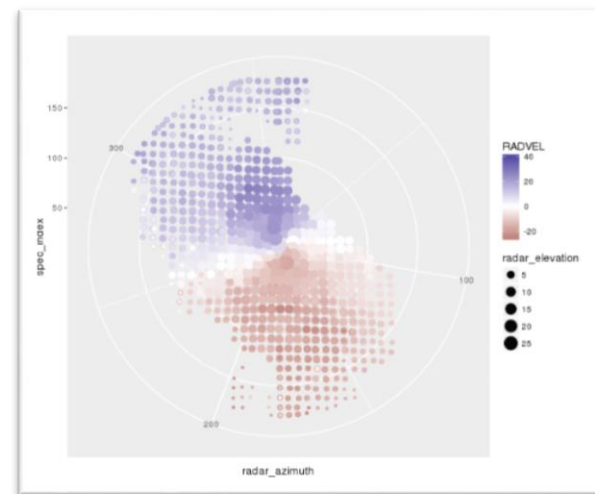

## II. Recent Developments within Rfdbk

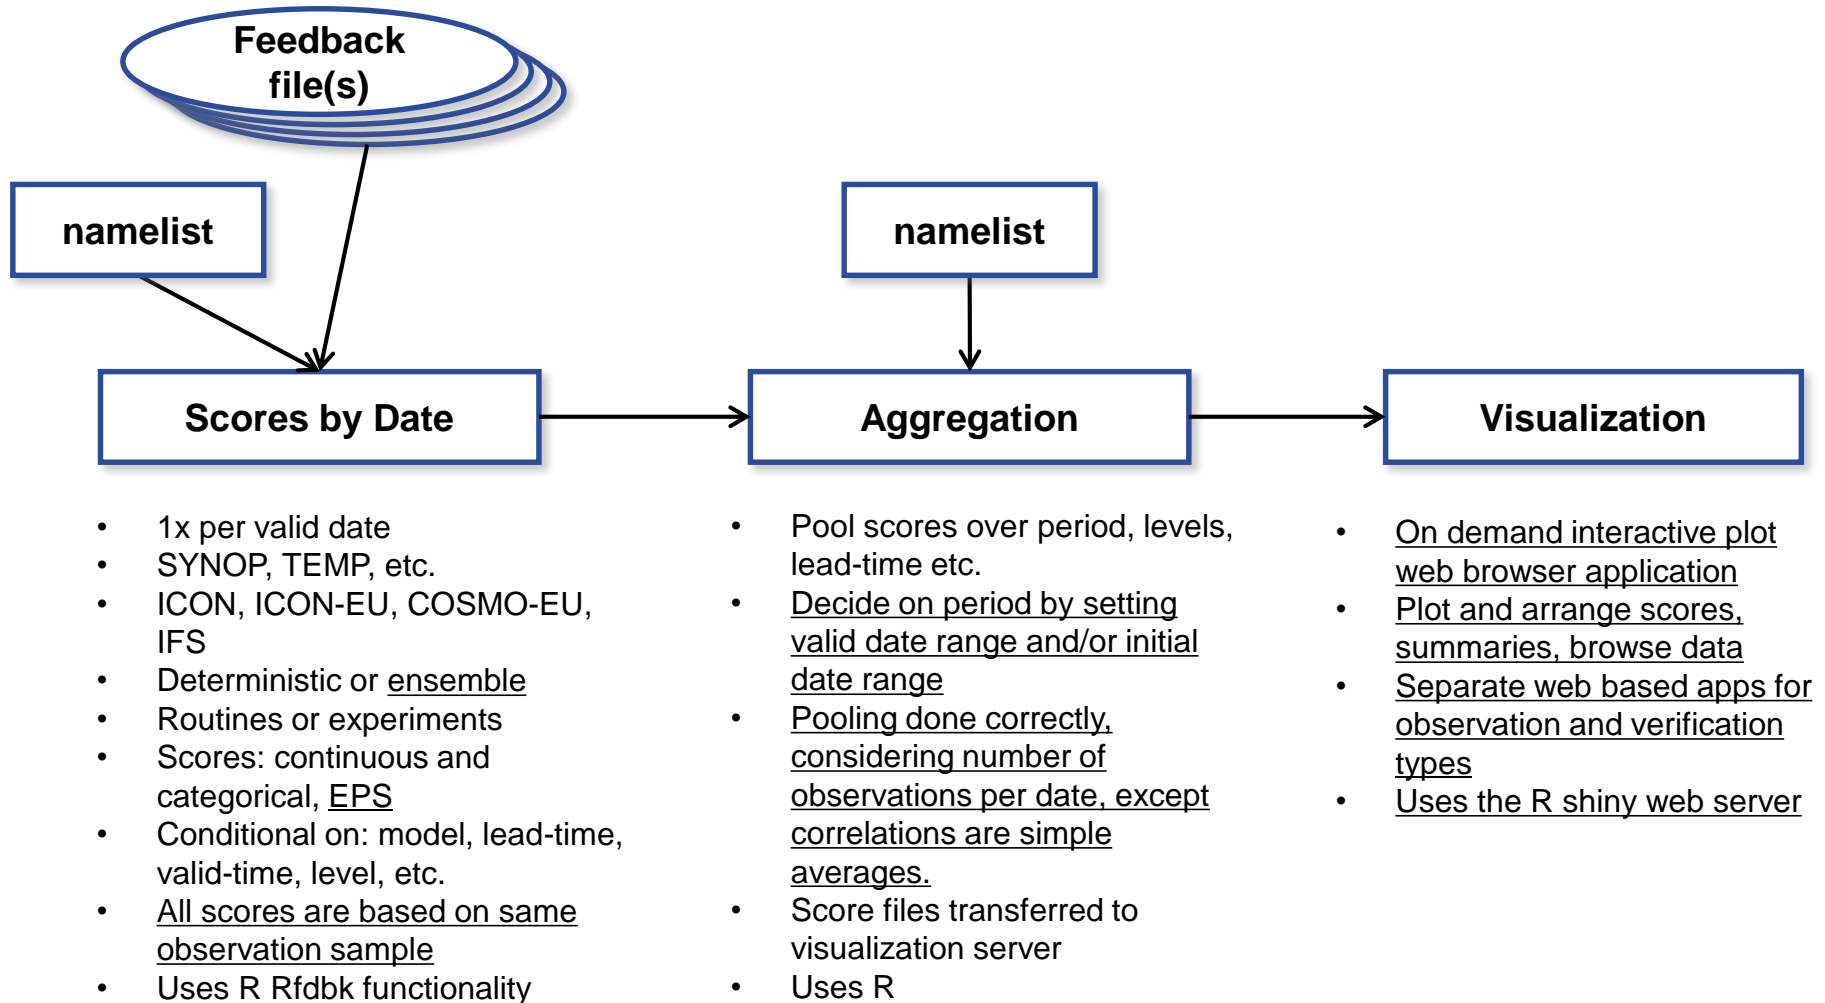

### Since CUS only small changes/bug-fixes have been conducted

- Rfdbk can now correctly deal with radar information, which are stored differently from other observation types (in order to account for sparse data and the underlying coordinate system)
- Rfdbk now has a function to help with conditional verification
- Function for CRPS calculation has been revised to accept missing values
- Function for adding past observation to forecast (needed to calculate persistence scores) does not cause errors in case of corrupt feedback files

```
varno obs lat lon
1 DD 1 10 5
2: DD 2 20 6
3: DD 3 30 7
4: FF 0 10 5
5: FF 1 20 6
6: RR 4 10 8
> fdbk_dt_conditional(DT,condition="varno=='DD'",on="varno=='FF' & obs>0",by=c("lon","lat"))
varno obs lat lon
1: FF 0 10 5
2: FF 1 20 6
3: RR 4 10 8
4: DD 2 20 6
```

# III. Recap of Verification

## IV. Recent verification progress

### Status

- Observation Types: SYNOP, TEMP, GPSRO, SATOB (AMV), PILOT (wind profiler)
- Models: ICON, ICON\_P, ICON\_P1, ICON-EU, ICON-EU, ICON-EU\_P1, ICON-EPS, ICON-EPS\_P1, COSMO-EU, COSMO-DE, COSMO-DE\_P, COSMO-DE-KENDA, COSMO-DE-EPS, COSMO-DE-EPS\_KENDABCEPS, COSMO-DE-EPS\_KENDAICON, IFS + experiments
- Verification types: continuous, categorical, ensemble, probabilistic
- Aggregation: by period, by valid-time, by station, time series of monthly means

### Missing

- Complete set of SYNOP observations in ICON feedback files
- Observations contained in national bufr file (RR and GUST over Germany)

### Visualization examples (COSMO (DE-EPS) routine vs. KENDA)

- [Ensemble / Probabilistic](#)
- [Continuous / Categorical / Hit rates](#)
- [Continuous by Station](#)
- [Continuous time series](#)
- DIY/WMO

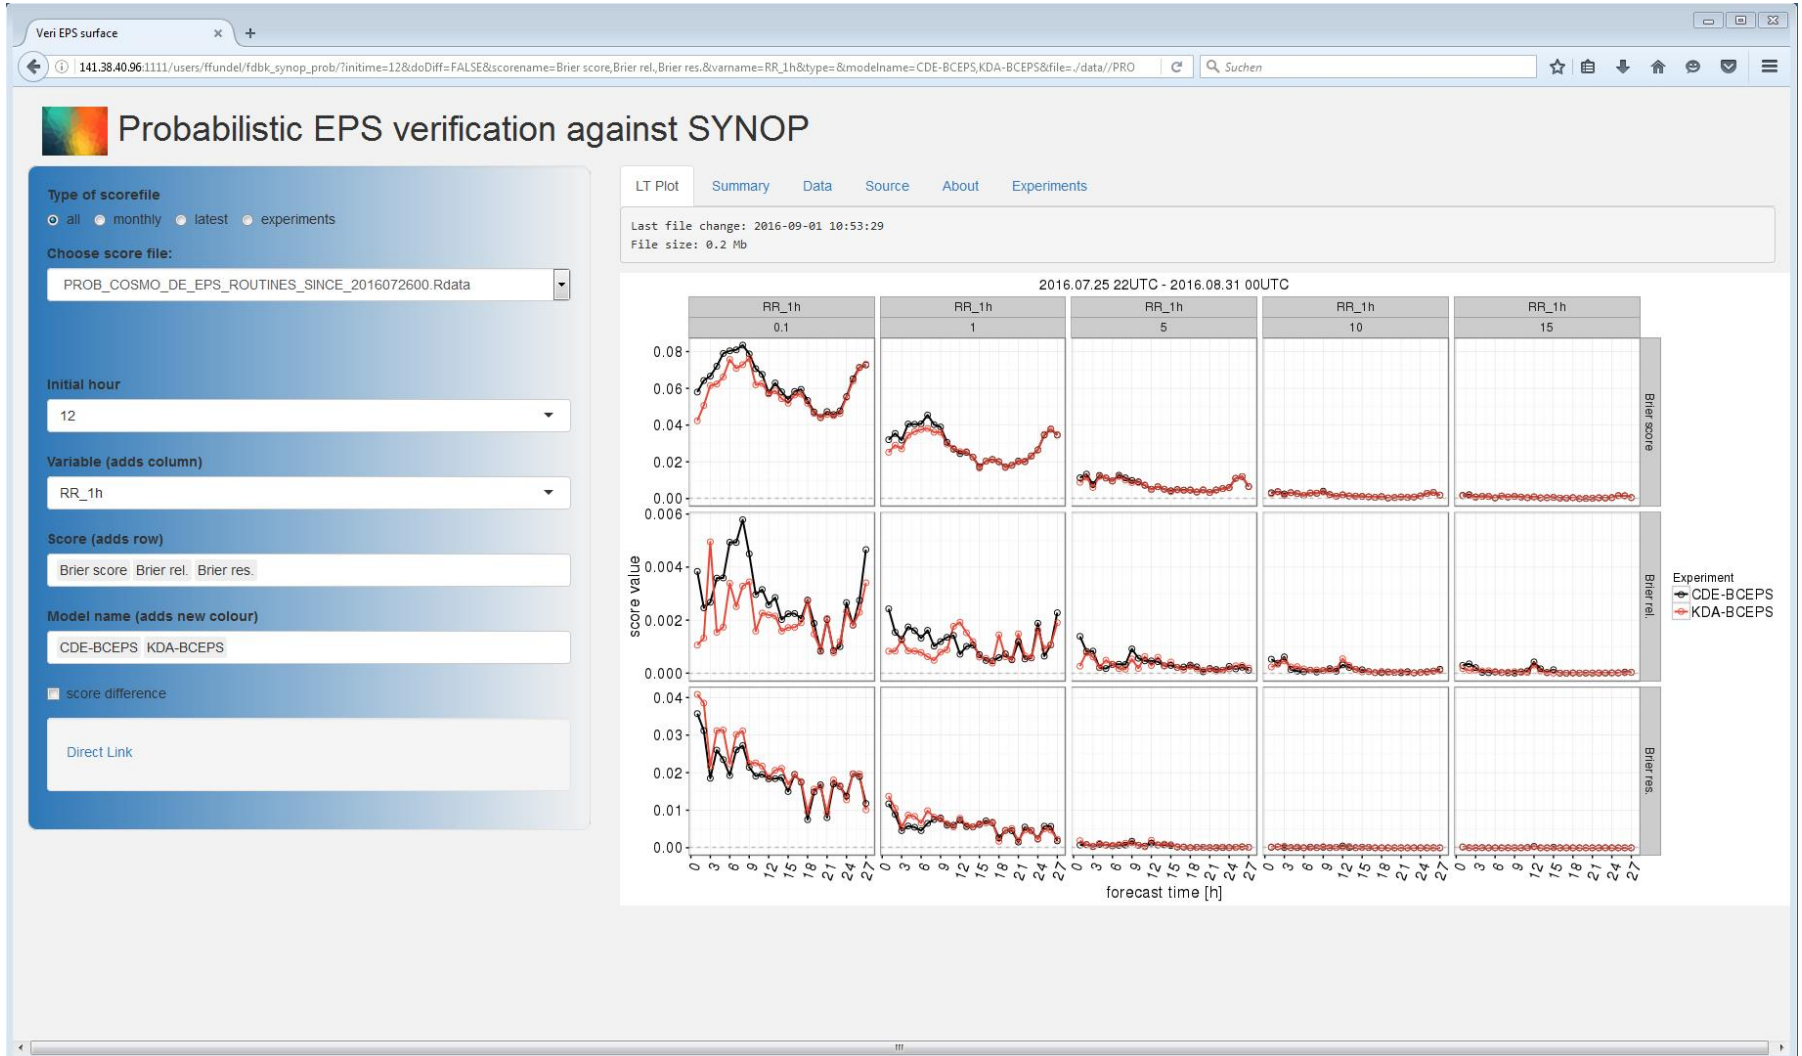

# V. Future Plans

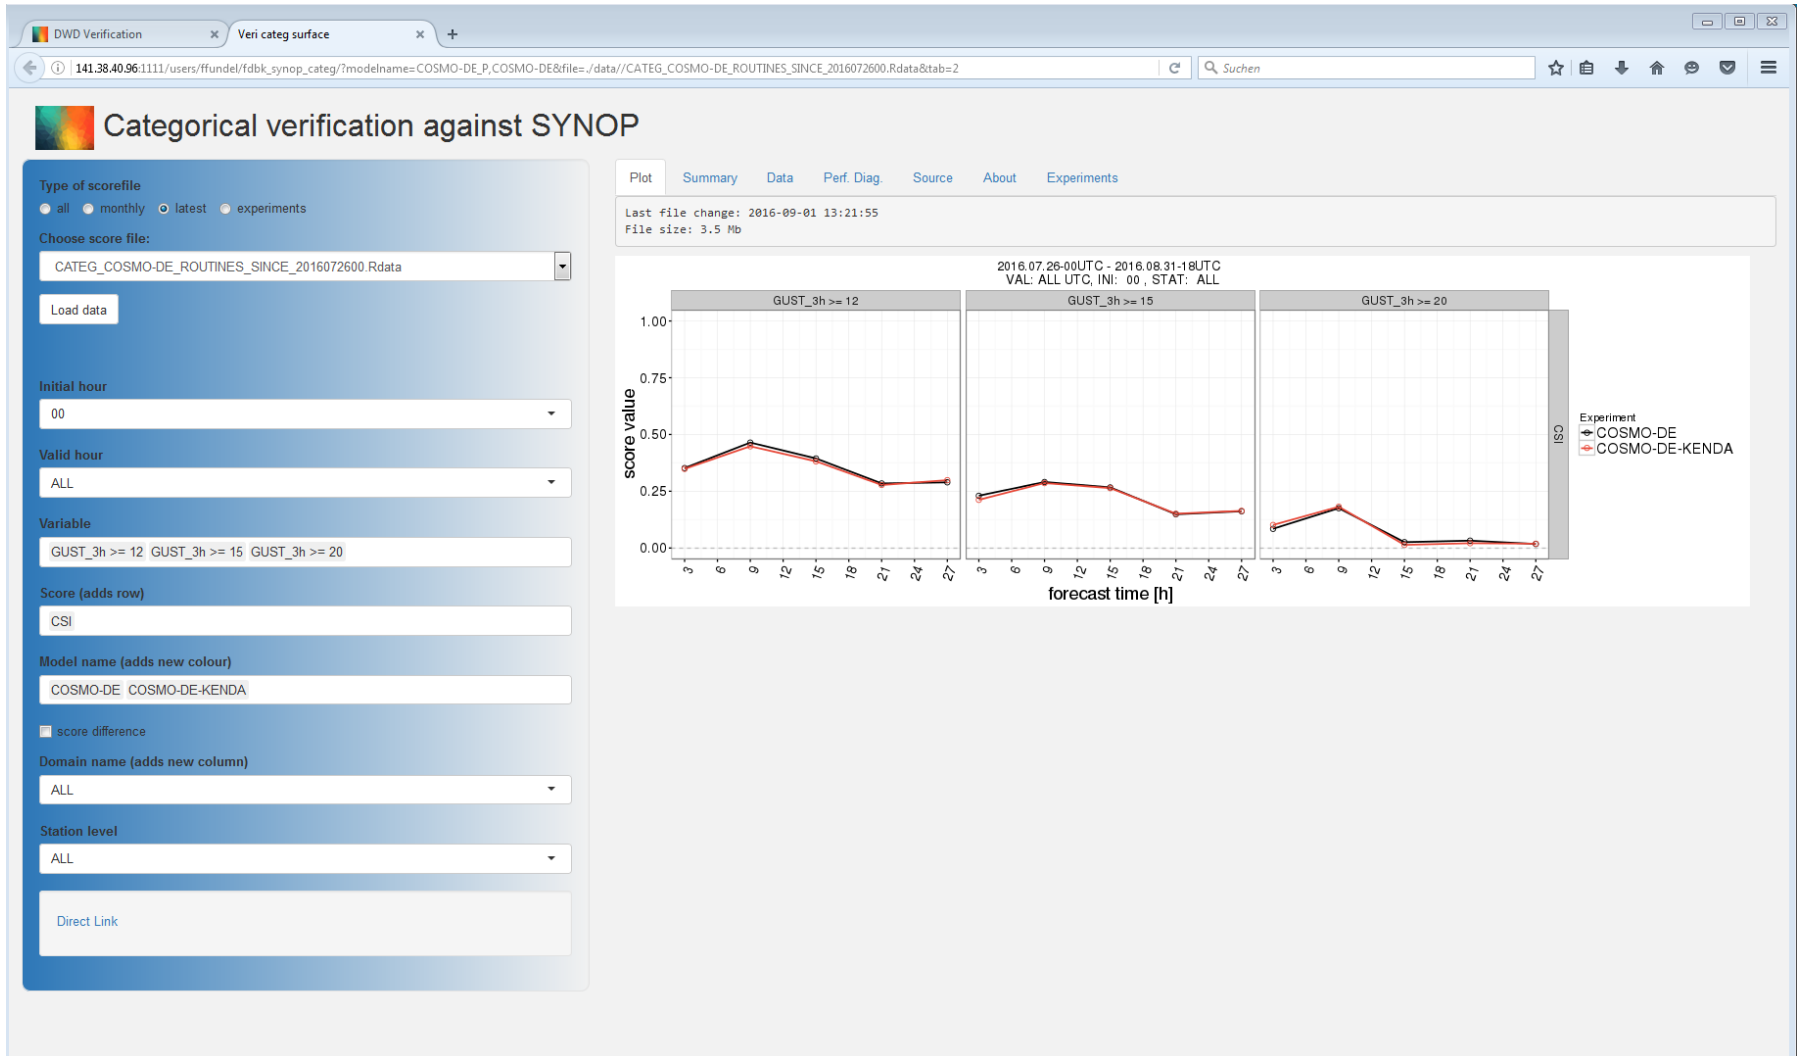

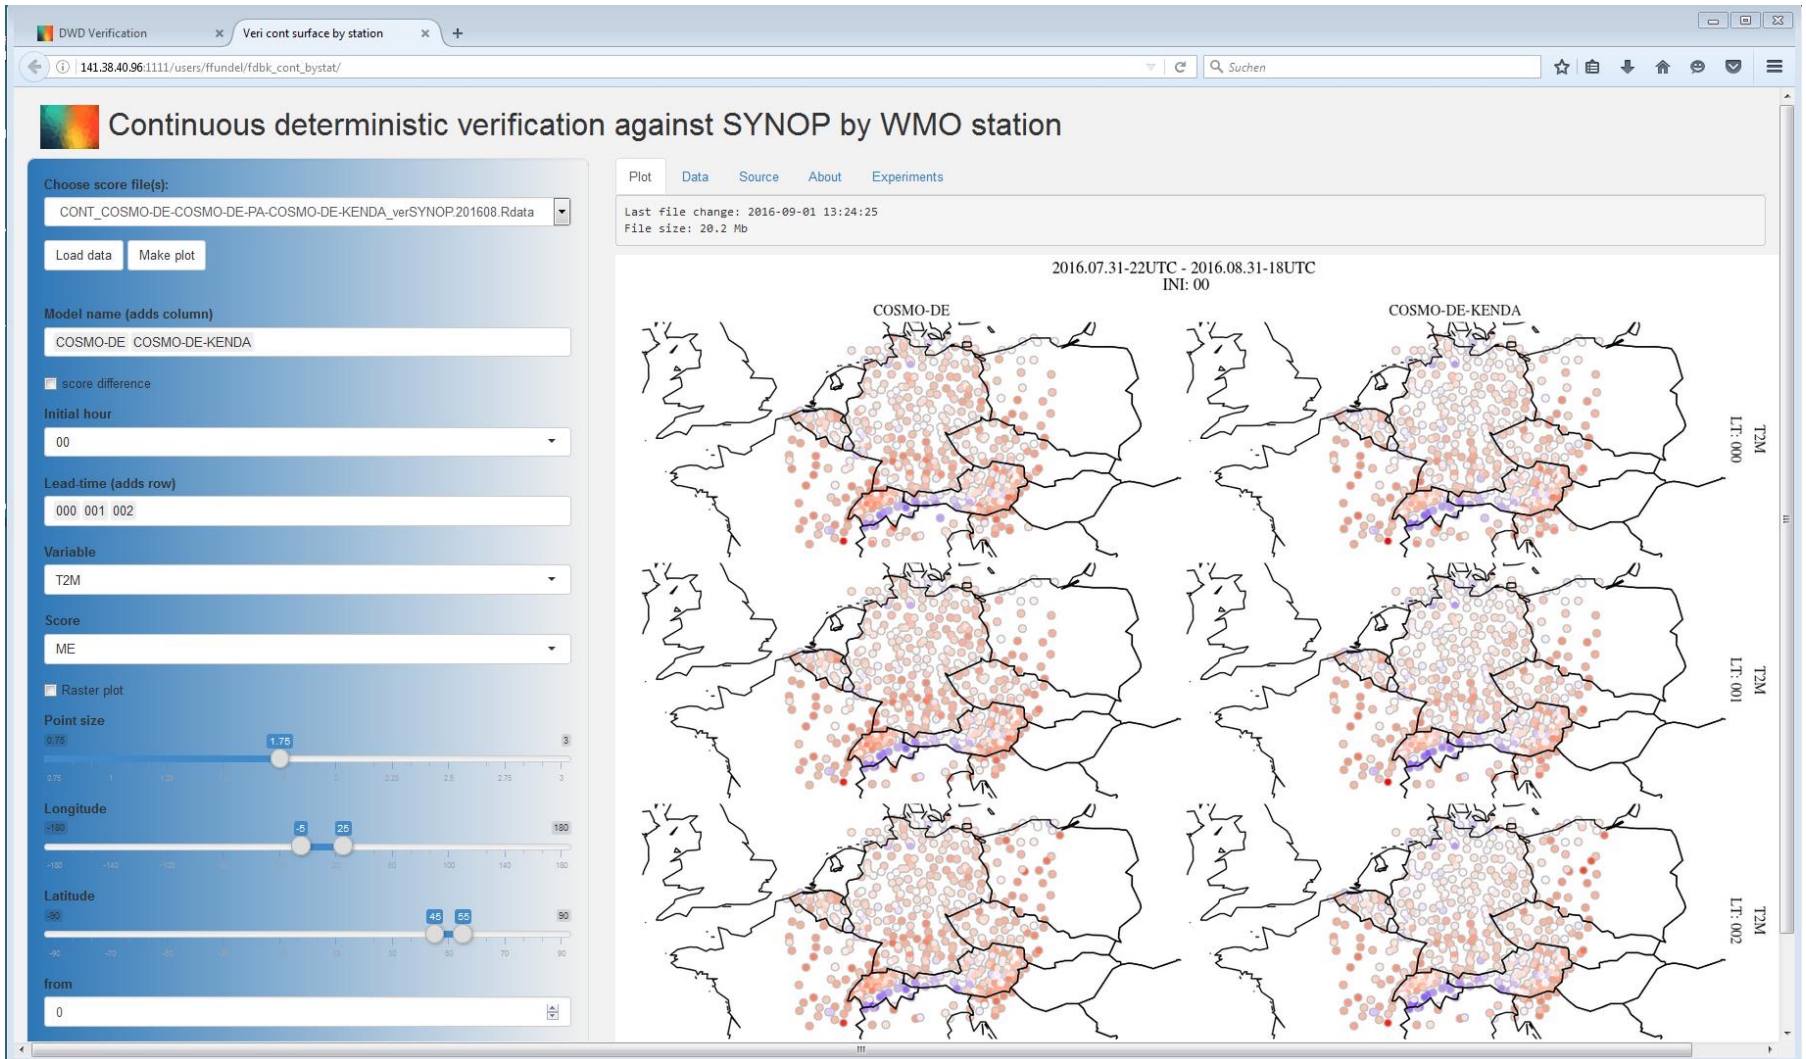

- Address issues with SYNOP verification of precipitation and gusts
- Work on confidence intervals for (some) scores (analytically or bootstrap)
- Move the verification scripts into routine/experiment environment to allow for an online verification
- Use aircraft measurements in verification/monitoring

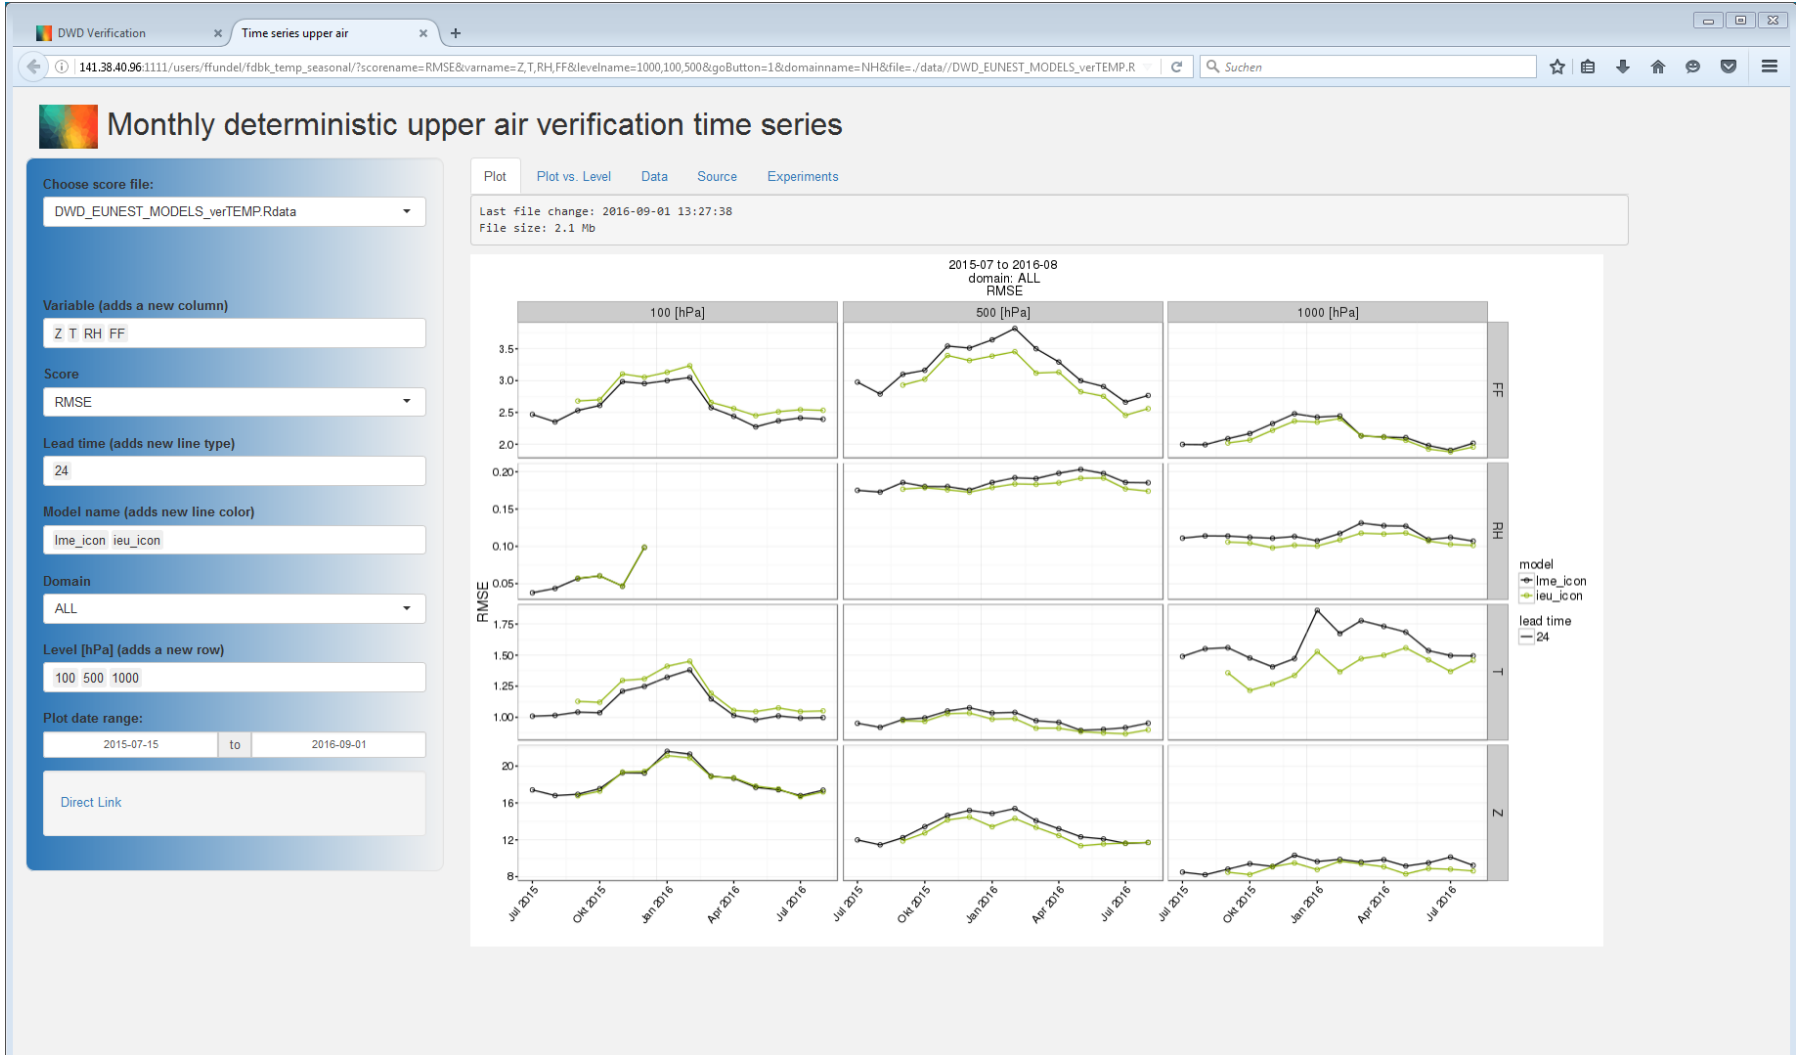

**Thank you for your attention**

WMO LC-DNV Global Model Verification Comparison (observations & analysis)

Truth: /data/observations.csv

Centre: GERMANY ECMWF AUSTRALIA FRANCE JAPAN U-KINGDOM

Variable (adds a new row): Temperature

Score: rmse

deseasonalize  
 deseasonalized only

Lead time: 24

Valid time: 12

Domain (adds a new column): nhem

Level [hPa]: 850

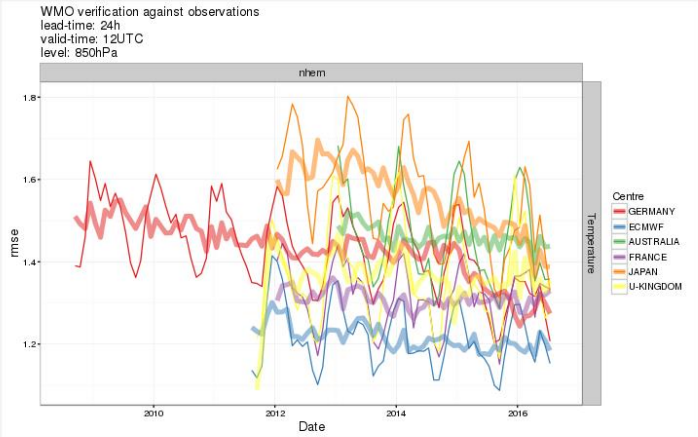

Date range: 2008-07-15 to 2016-09-01

Direct Link

Plot\_TS Plot\_LT Data Info Source

Last file change: 2016-08-31 22:06:52  
File size: 285.8 Mb

WMO verification against observations  
lead-time: 24h  
valid-time: 12UTC  
level: 850hPa

The chart displays the Root Mean Square Error (rmse) for temperature observations against various model centres from 2010 to 2016. The y-axis represents rmse, ranging from 1.2 to 1.8. The x-axis represents the date, with major ticks for 2010, 2012, 2014, and 2016. The legend identifies the centres: GERMANY (red), ECMWF (blue), AUSTRALIA (green), FRANCE (purple), JAPAN (orange), and U-KINGDOM (yellow). The plot shows significant seasonal and inter-annual variability in rmse for all centres, with peaks often occurring in the summer months. The U-KINGDOM and JAPAN centres generally show higher rmse values compared to others, while ECMWF shows the lowest values.

## Model equivalent Calculator MEC

### Installation

- Sources: Fortran 2003/2008 and some C sources from DWD
- Makefile for gfortran is provided
- NetCDF, CGRIBEX (MPI Hamburg), GRIP-API (ECMWF), (MPI recommended)
- Fortran compiler, C compiler
- Sufficient memory to hold one model state (1 ensemble state)

### Required model input

- Grib or Grib2 files
- COSMO, ICON (EU Nest), IFS, HRM, ECHAM (not fully tested)
- PS, T, U, V, P, Q (mandatory, all model levels)
- T2M, TD2M, CLC, CLCT, CLCL, CLCM, CLCH, CLC, H\_SNOW (optional)
- TOT\_PREC, VMAX\_10, TMIN\_2M, TMAX\_2M (optional, next release)

### Required observation input

- fof/mon/cof/ekf/ver –files (existing fdbk files from nudging, LETKF or MEC)
- CDFIN (BUFR converted by bufrx2netcdf to NetCDF, BUFR in WMP-templates as used by DWD)

### Output

- ver-files, NetCDF feedback files including past forecasts
