

# *Latest news about SnowWE from the SCA*

*Evgenii Churiulin, Vladimir Kopeykin, Inna Rozinkina*

# Research territory

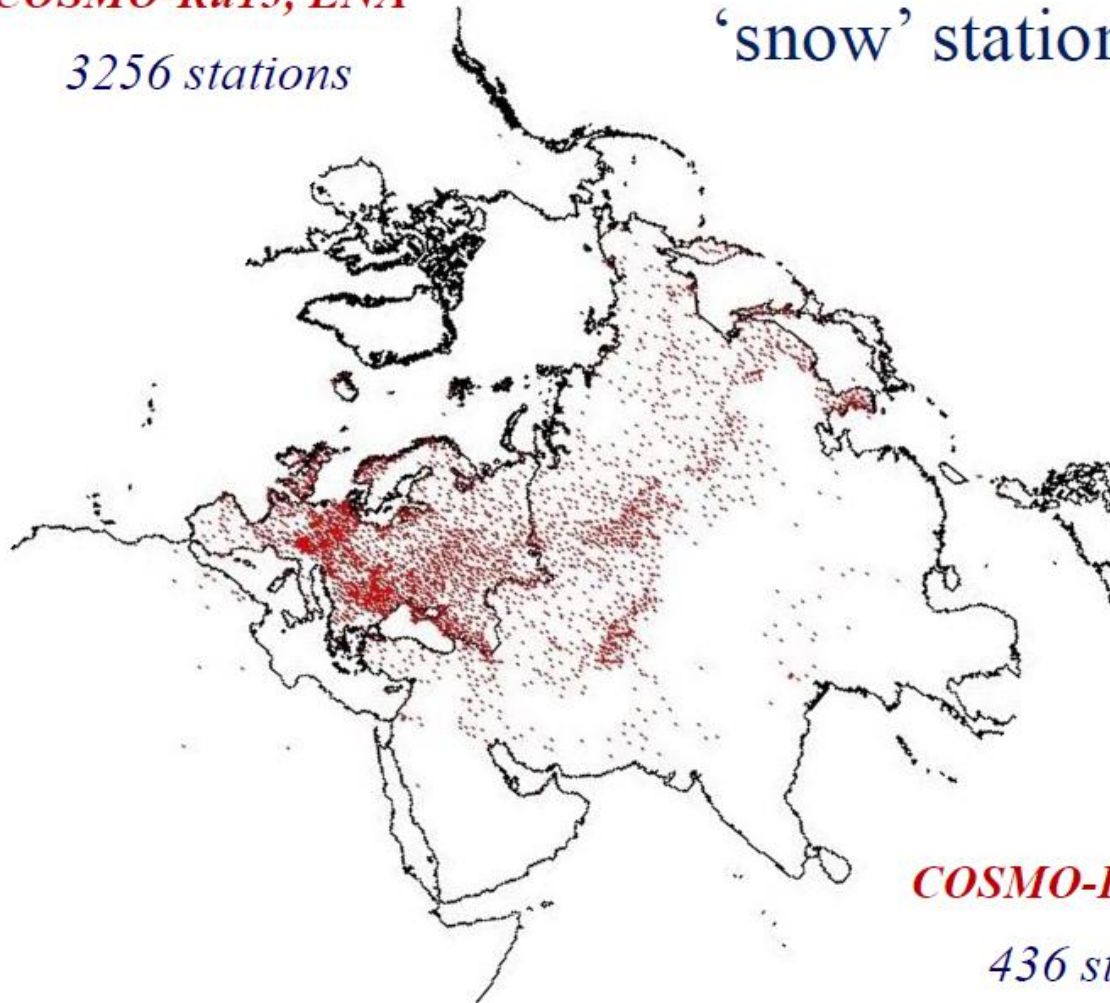

SYNOP

'snow' stations

**COSMO-Ru13, ENA**

3256 stations

**COSMO-Ru7, ETR**

2163 stations

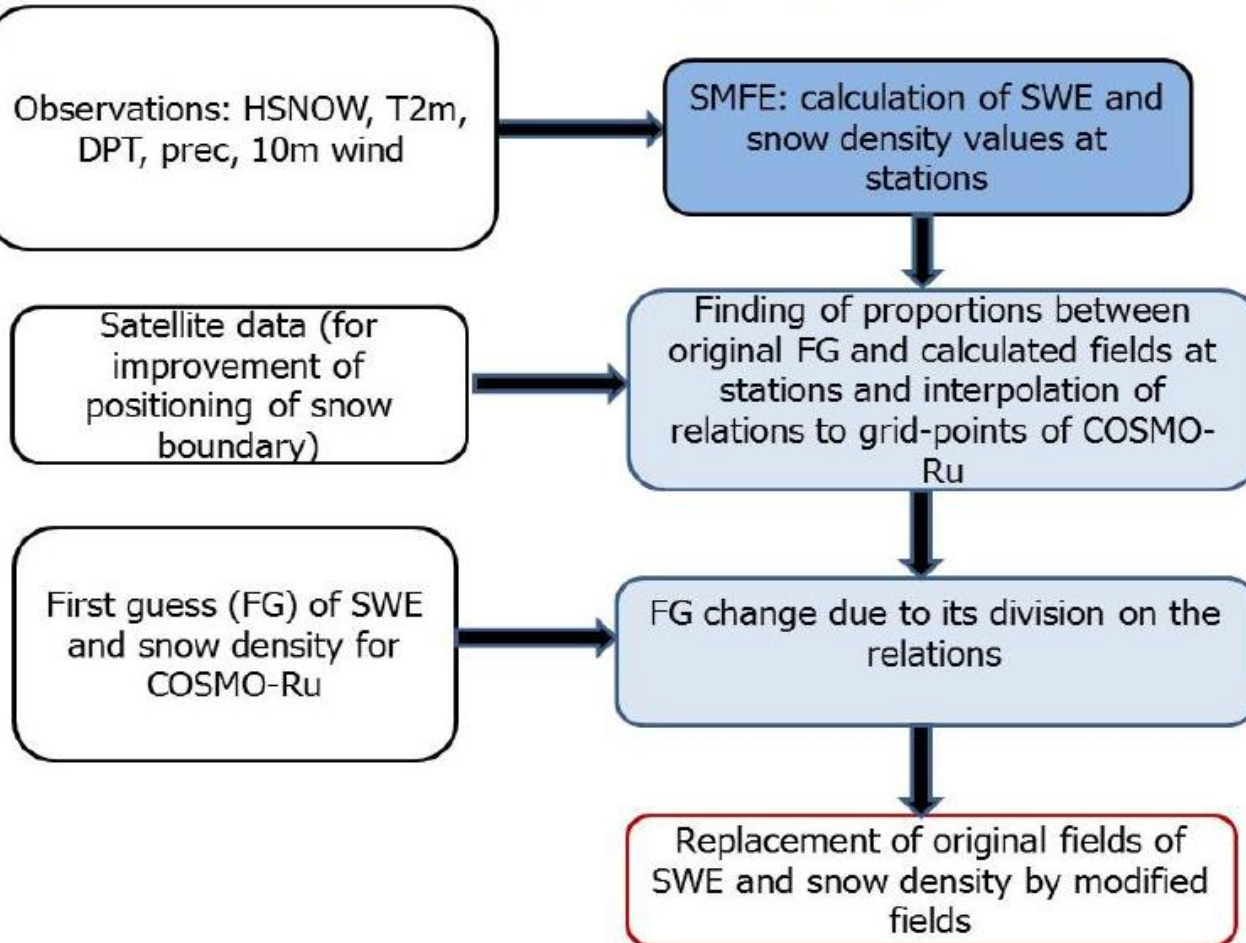

**COSMO-Ru 2 CFO**

436 stations

## OA of snow cover characteristics for NWP model (exemplifying COSMO-Ru)

In **quasi-operational regime** since 1 December 2014 for:  
*COSMO-Ru7, ETR* versions with 7 km resolution

*COSMO-Ru2, CFO* versions with 2 km resolution

Since 1 March 2016 – for  
*COSMO-Ru13, ENA* versions with 13.2 km resolution

Calculation of **SWE** and snow density (**RHO**) through the developed snow model **SMFE** can be executed

At **SYNOP** stations

At **COSMO-grid** points

**New direction - 1:** forecast of snow cover characteristics based on COSMO-grid points (until 72 hours)

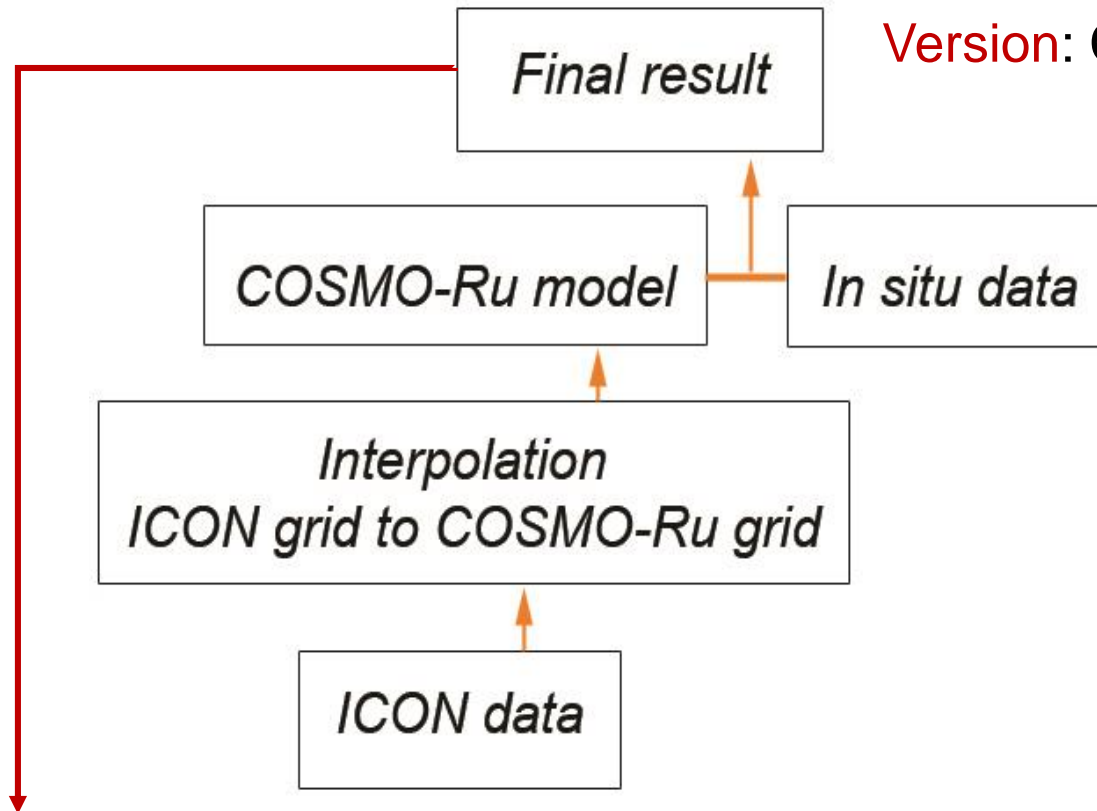

**New direction - 2:** Improve situation with calculation of snow cover in forest regions

**New direction - 3:** Improve physical block of SnoWE (increase opportunities of SnoWE)

The initial data for *SnoWE*

Version: SYNOP stations

Version: COSMO grid points

❄ Values of air temperature for hours (00, 06, 12, 18 UTC)

❄ Values and physical state of precipitation

❄ Values of SWE and RHO

❄ Values of snow depth

The initial data for *SnoWE*

Version: SYNOP stations

Version: COSMO grid points

Values of air temperature for *endurance* hours (00, 06, 12, 18 UTC) for 1 day

Average air temperature

Maximum air temperature

Values of SWE and RHO

Average values of SWE and RHO for each grid point

For mountain regions use data as border conditions

The initial data for **SnoWE**

Version: SYNOP stations

*In situ data from a local database (SYNOP information)*

*Hsnow*

*T2m*

*DPT*

*precipitation*

*10m wind*

*Calculating of **SnoWE model** based on the available meteorological data*

*If we have a dense network of the meteorological observations*

*If we have a sparse network of the meteorological observations*

*A step of irregular grid < 100 km*

*A step of irregular grid > 100 km*

**Version:** SYNOP stations

Interpolation of **SWE (RHO)** calculated values in the resulting COSMO-Ru grid

Interpolation of the **ratio** between SWE (RHO) calculated values at meteorological stations and average values of ICON for grid-points inside a certain radius

Correction of the ICON values by the interpolation ratio

- COSMO or ICON grid points
- In situ data

- COSMO or ICON grid points
  - In situ data
- $R = \frac{\text{SWE calculation}}{\text{SWE icon(cosmo)}}$

# SnoWE versions

<i>Research territory</i>	<i>Radius (Default)</i>
<i>COSMO-Ru 13, ENA</i>	<i>14000 meters</i>
<i>COSMO-Ru 7, ETR</i>	<i>8000 meters</i>
<i>COSMO-Ru 2, CFO</i>	<i>3000 meters</i>

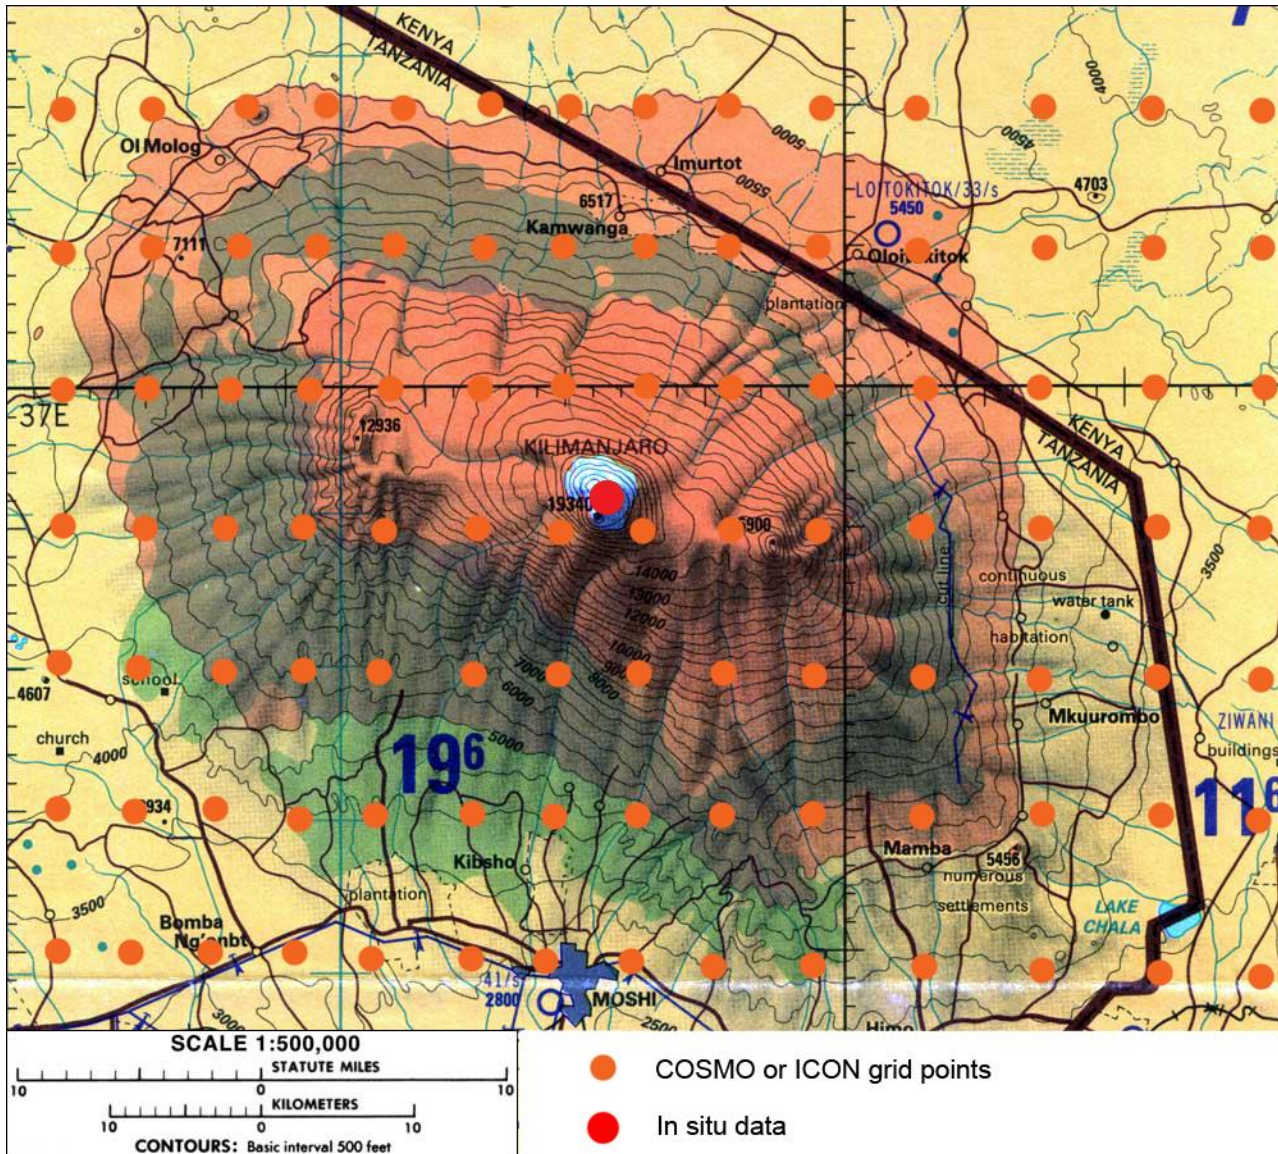

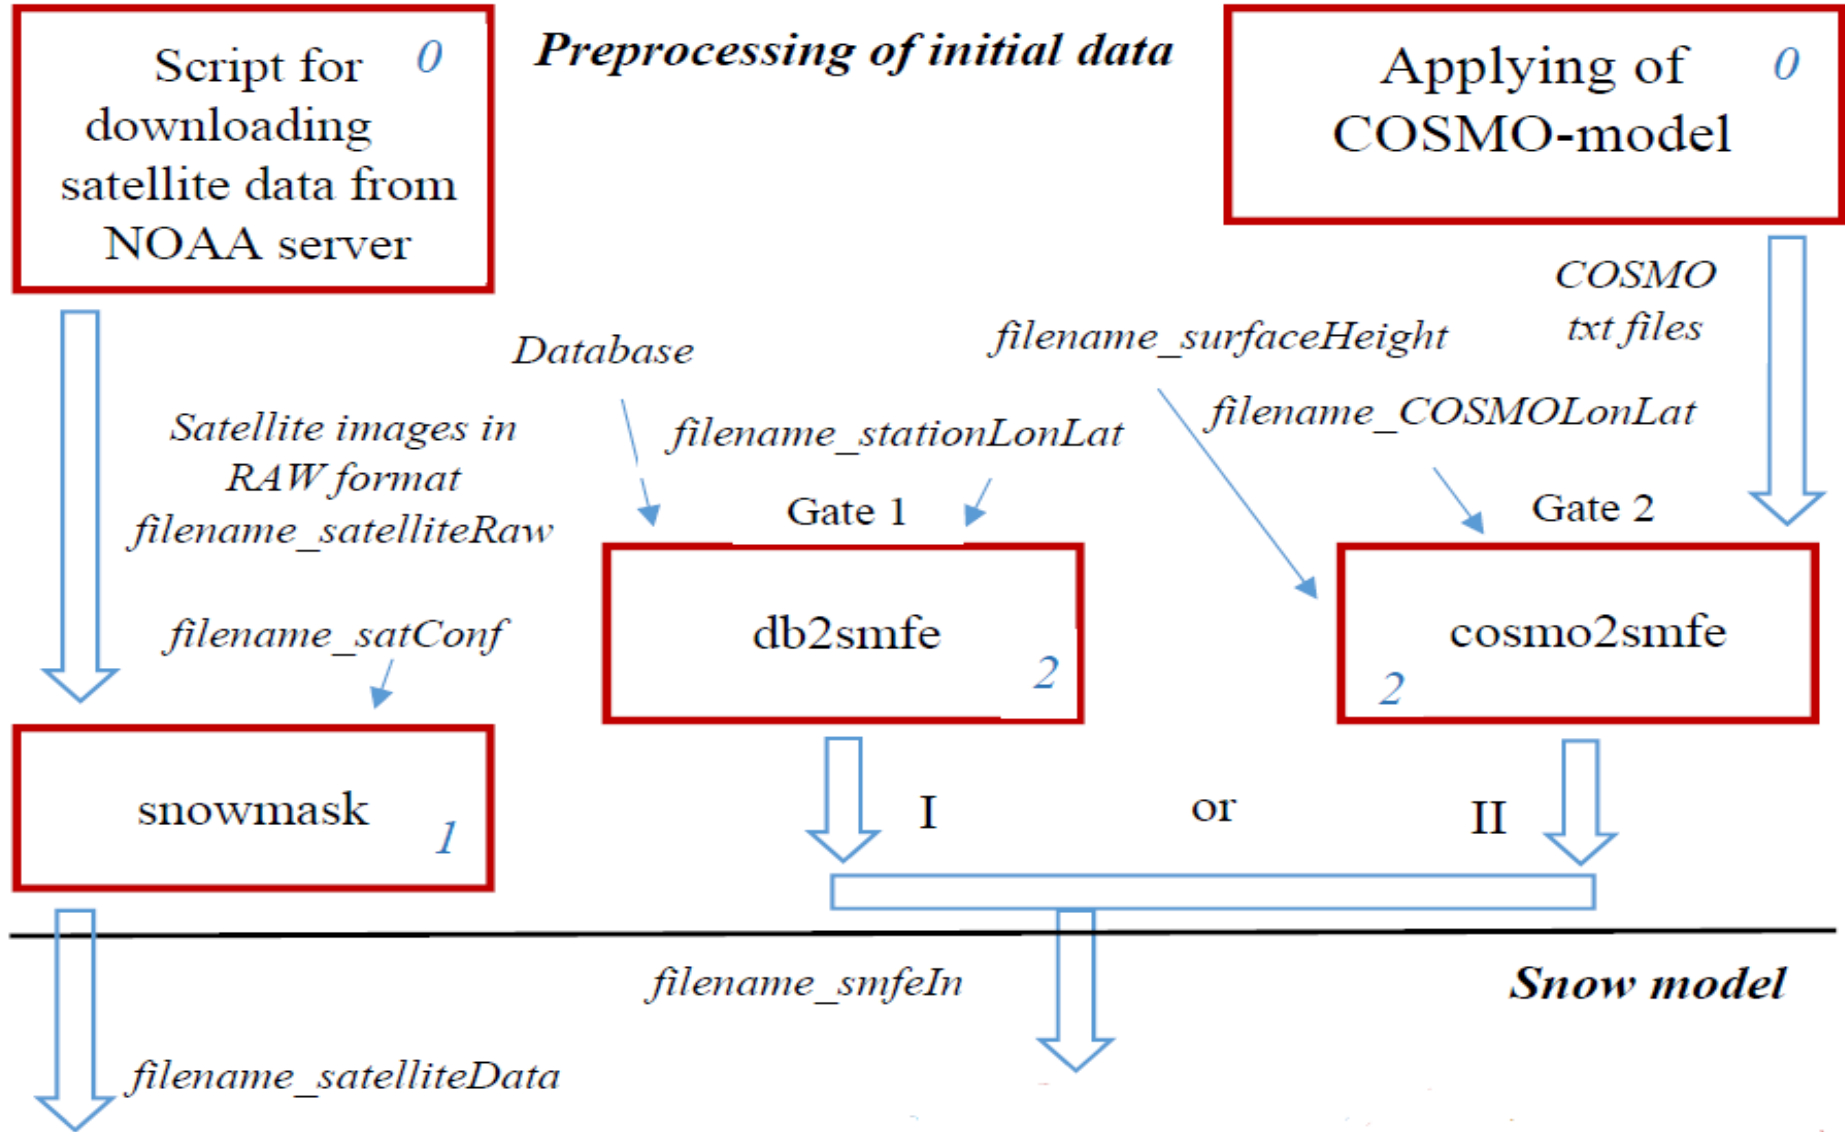

Output data (final result)

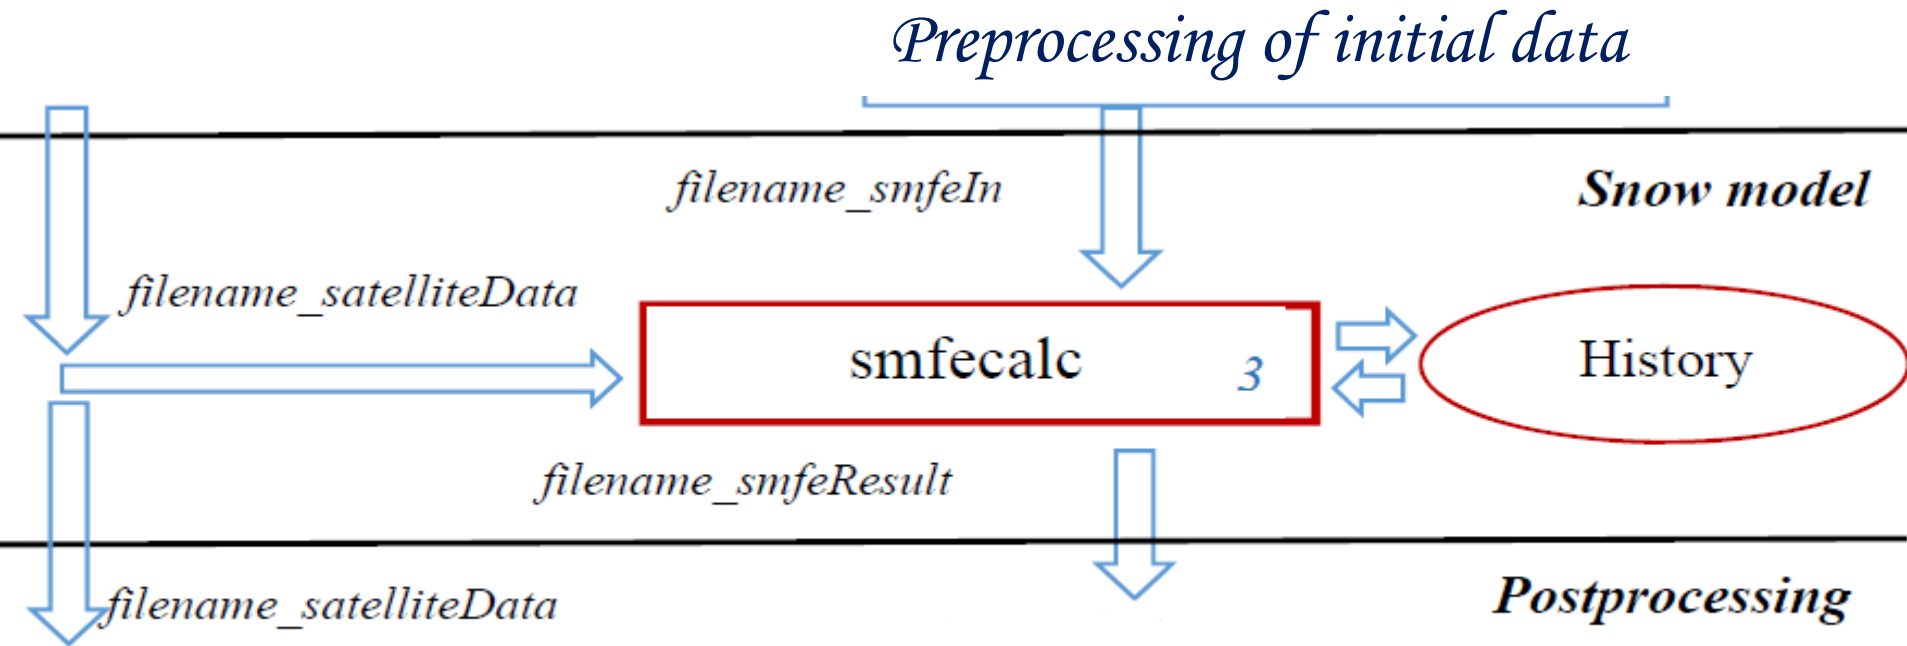

**Version:** SYNOP stations

**Version:** COSMO grid points

Field of SWE (RHO) values for each COSMO-Ru grid point in GRIB format

*SWE and SD values depend on the **whole** previous weather winter history.*

*Moreover, the use of constants and aging functions for SD for long periods can lead to wrong results*

# Multi-layer SnowE

Determining presence of snow cover

First snow

Snow cover

No snow

Comparison of snow depth for current and previous day

Snow depth  
increases

Snow depth  
doesn't change

Snow depth  
decreases

S e l e c t i o n   o f   c a s e s

Case of wet  
snow falling

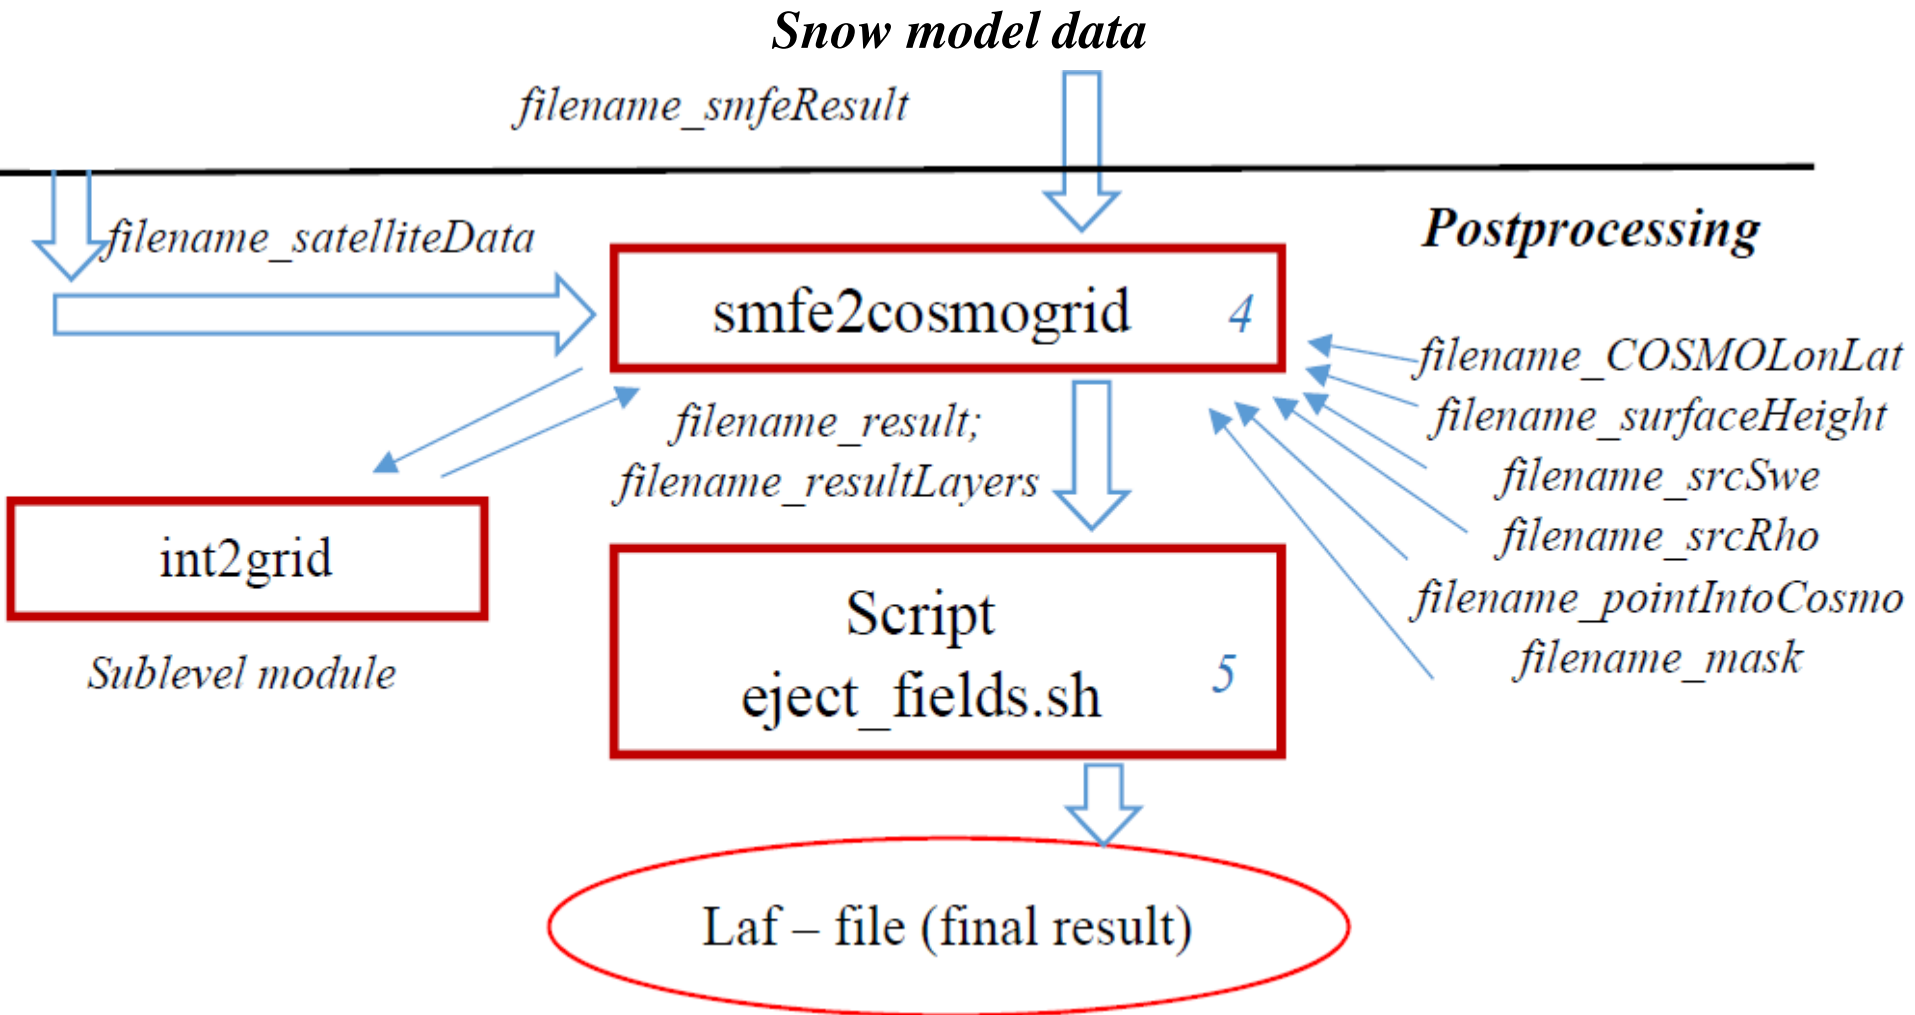

Case of dry  
snow falling

Case of snow  
blown

Case of snow  
melting and  
subsidence

*Output parameters:* density of each layer as well as *SWE* and *average snow density* for the whole snow column

SMFE  
doesn't work

## The North Dvina river

from 08.2002 to 07.2007

from 08.2012 to 08.2017

Comparison charts of restored SWE values and real SWE values

1 – GLADAS (1 type); 2 – GLADAS (2 type); 3 – GlobSnow; 4 – in-situ data;

5 – SnoW&E technology

## The Oka river

from 08.2002 to 07.2007

from 08.2012 to 08.2017

Comparison charts of restored SWE values and real SWE values

1 – GLADAS (1 type); 2 – GLADAS (2 type); 3 – GlobSnow; 4 – in-situ data;

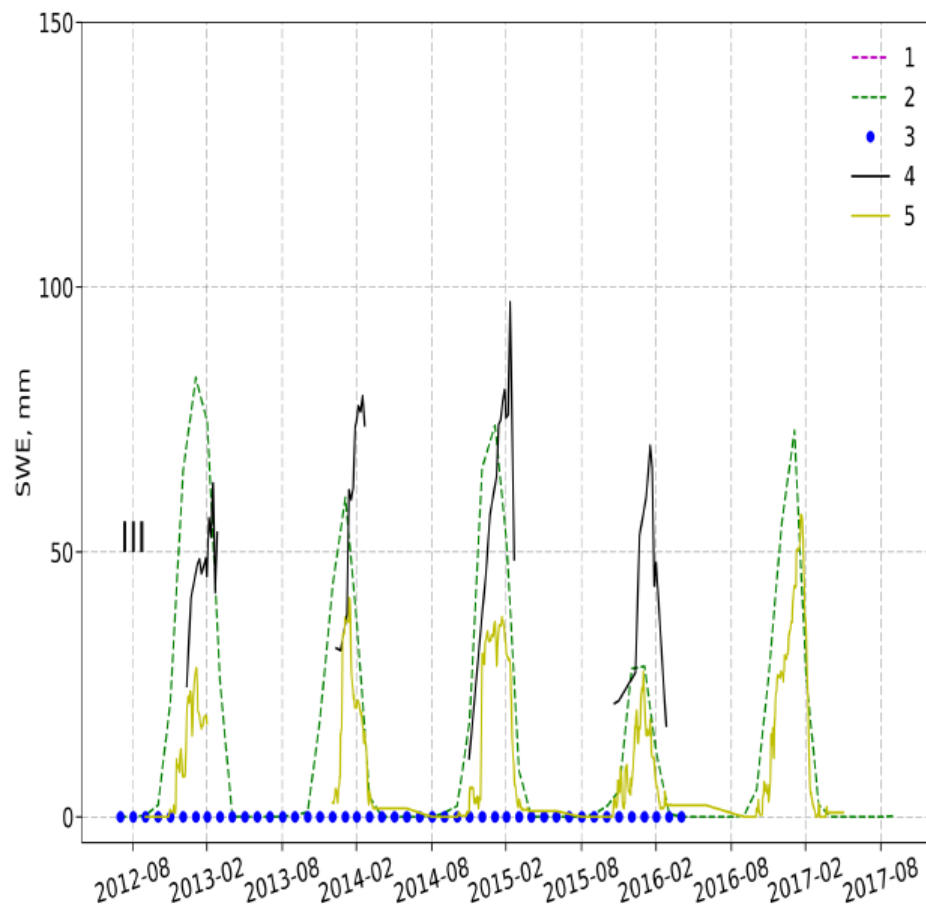

5 – SnowWE technology

## The Don river

from 08.2002 to 07.2007

from 08.2012 to 08.2017

Comparison charts of restored SWE values and real SWE values

1 – GLADAS (1 type); 2 – GLADAS (2 type); 3 – GlobSnow; 4 – in-situ data;

5 – SnoWE technology

## Catchment area of the North Dvina river – the Mezen meteorological station from 01.08.2016 to 31.05.2017

A

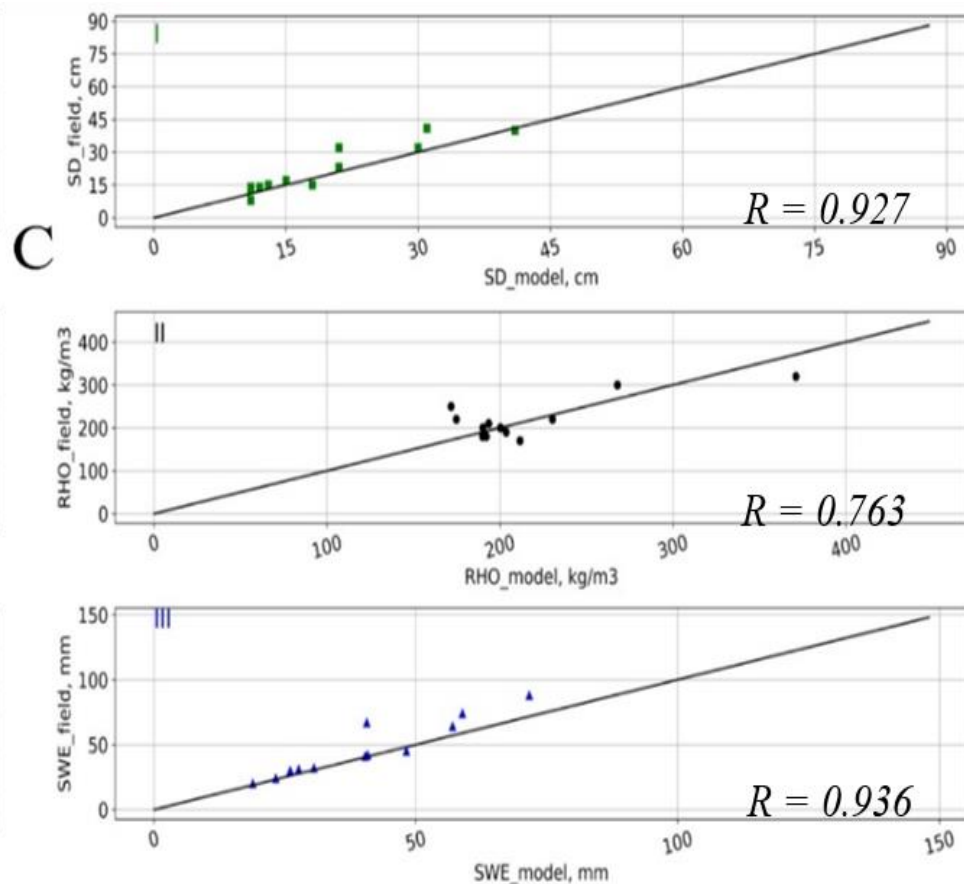

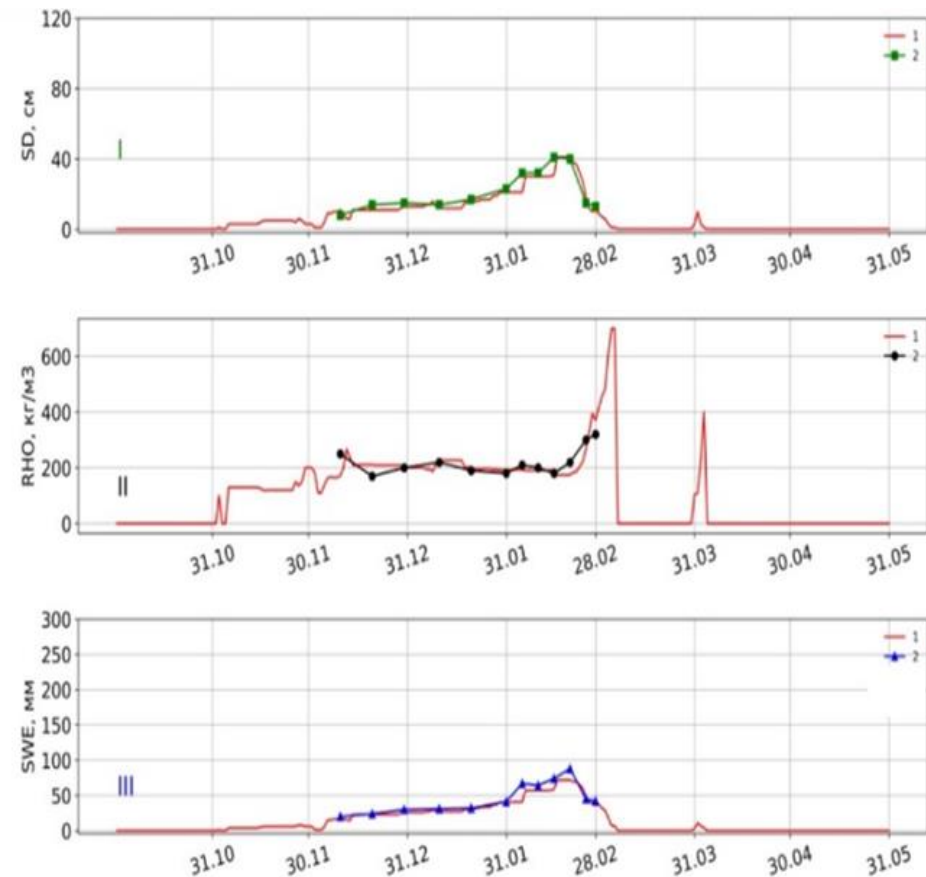

Comparison charts of restored snow values and real snow values: I – height of snow (**SD**); II – snow density (**RHO**); III – snow water equivalent (**SWE**); 1 – SnoWE technology; 2 – in-situ data

## Catchment area of the Okka river – the Michurinsk meteorological station from 01.08.2016 to 31.05.2017

Comparison charts of restored snow values and real snow values: I – height of snow (**SD**); II – snow density (**RHO**); III – snow water equivalent (**SWE**); 1 – SnoWE technology; 2 – in-situ data

## Catchment area of the Don river – the Kalach meteorological station from 01.08.2016 to 31.05.2017

Comparison charts of restored snow values and real snow values: I – height of snow (**SD**); II – snow density (**RHO**); III – snow water equivalent (**SWE**); 1 – SnoWE technology; 2 – in-situ data

# Conclusions

*The data of **SnoWE** technology (fields of SWE values) were applied in the spring flood time in 2016/17, 2017/18 for the territory of the Russian Federation*

*New gates for data downloading have been implemented*

*Program code of SnoWE technology were updated*

*Python scripts for graphical visualization were created*
