Subtask 2.2 New urban external parameters in EXTPAR for ICON(-LAM)

METEO
IMGW-PIB
meteo.imgw.pl

CMCC and IMGW-PIB will contribute to implement the dataset in EXTPAR and to test its impact on the modelled thermal environment.

Apreda C., Schulz J.-P., Reder A., Mercogliano P.: Update on urban canopy parameters for EXTPAR, Survey of the existing datasets to derive ISA, 23rd COSMO General Meeting, 2021

LCZs looks very promising for the aims of PP-CITTÀ

LANDUSE CLASS

It looks correctly

EXTPAR (COSMO software for production of external parameters) source code is available in a private repository in the C2SM organization on GitHub.

The latest version is 5.7

EXTPAR needs the following Python-packages and installations:

- at least Python 3.6
- module netCDF4

! Problem was found preventing installation of the netCDF4 module in conda environment with python version 3.10 (bug in conda) – 3.9 was chosen instead

This repository contains ~380 GB of data.

	aerosols	albedo	emiss	flake	landuse *	ndvi	soil	urban	cru	topo *	era5
memory usage	125 MB	7.1 GB	1.2 GB	2.7 GB	380 MB	1.7 GB	3.6 GB	14 GB	3.3 MB	138 GB	117 MB

The input data is available on mistral (DKRZ) through GitLab.

Extpar-input-data requires a git-lfs installation.

Access to both repositories has been granted with Jonas Jucker help.

EXTPAR compilation and input data downloading in IMGW-PIB need some HPC's software update (python update to 3.6, git lfs installation) but data cloning from github/gitlab repositories has been successfully tested on desktop machine.
