Verification highlights of the new MeteoSwiss models COSMO-1E and COSMO-2E

ModInterim project team: André Walser, Pirmin Kaufmann, Jean-Marie Bettems, Andreas Pauling, Jan-Peter Schulz, *and many more*

COSMO-1E & COSMO-2E

Lateral boundary conditions:
IFS ENS & HRES
18km / 0.2°
4x per day

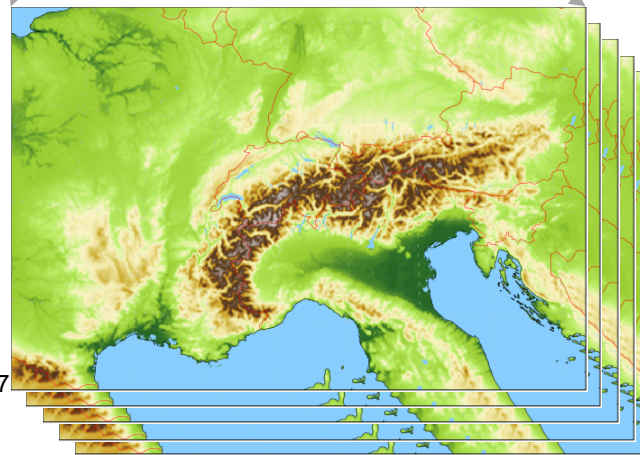

Lateral boundary conditions:
IFS ENS
18km / 0.2°
4x per day

ensemble data assimilation: LETKF at 1.1km

COSMO-1E: 33 hour forecasts, 8x per day
1.1km grid size (convection permitting)
11 ensemble members

COSMO-2E: 5 day forecasts, **4x** per day
2.2km grid size (convection permitting)
21 ensemble members

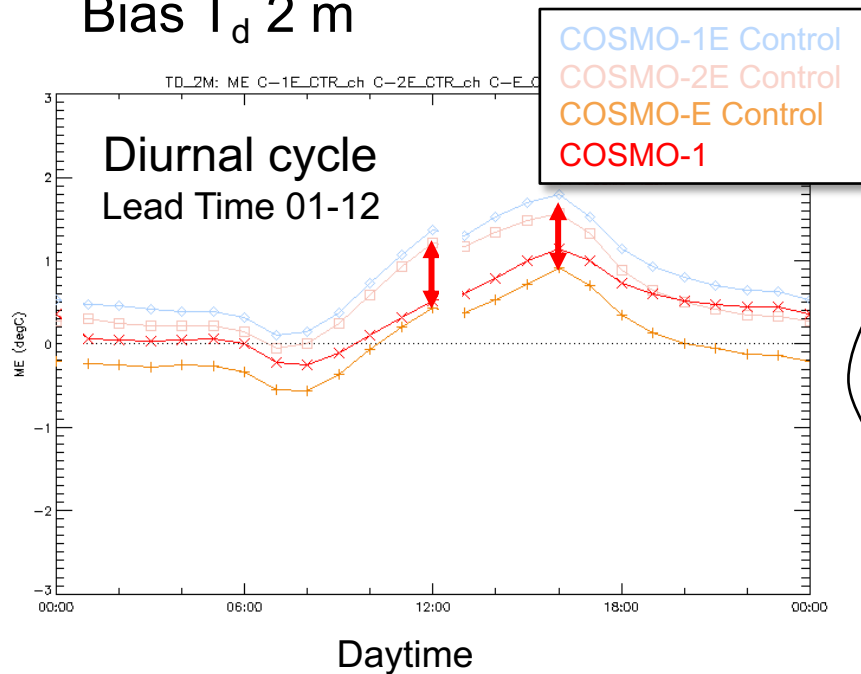

Migration to COSMO version 5.07 (from 5.0++)

- Namelist settings: “Standard”, i.e. no “fundamental” differences to neither COSMO-E nor COSMO-D2-EPS
- Problem in pre-operational runs observed in early spring:
 - Td2m too high (too moist), especially in spring 2020
 - soil much wetter than for COSMO-E

Problem (!): Td2m in March 2020

Bias T_d 2 m

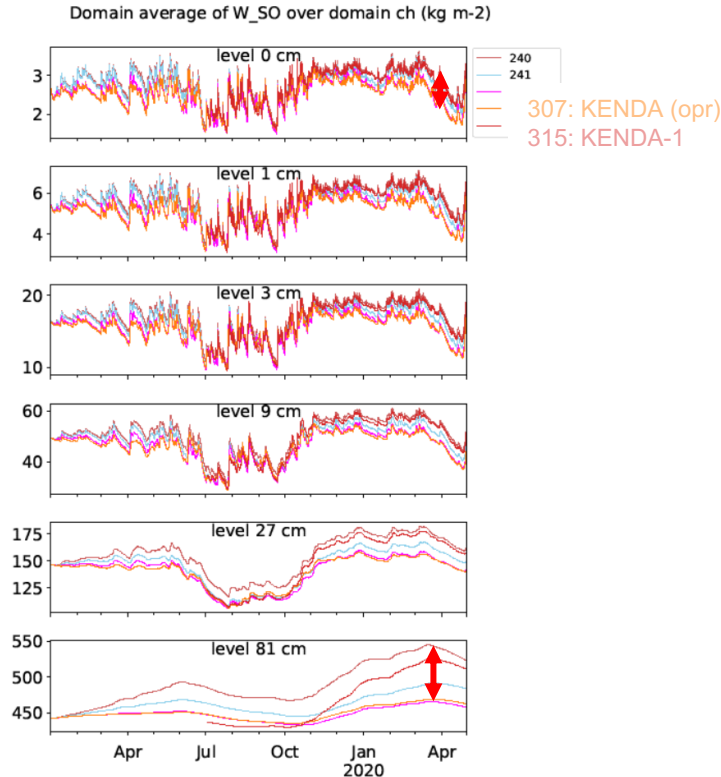

Time series

Problem (?): soil water (W_SO)

substantial loss of soil water in COSMO-1 and COSMO-E due to a **programming bug** (fixed in COSMO v5.04):
on average $\approx 200\text{-}300$ mm/y

soil of KENDA-1, COSMO-1E, and COSMO-2E is significantly wetter (and most likely more realistic ...) than in COSMO-1 and COSMO-E (and, yes, also in COSMO-D2-EPS ...)

needed to re-tune the model ...

Help from Jan-Peter Schulz and Gerd Vogel

Use of namelist settings recommended by WG3b based on paper by Jan-Peter Schulz and Gerd Vogel («Improving the Processes in the Land Surface Scheme TERRA: Bare Soil Evaporation and Skin Temperature», Atmosphere 2020, 11, 513; <https://doi.org/10.3390/atmos11050513>; see <http://www.cosmo-model.org/content/tasks/workGroups/wg3b/docs/TERRAsettings.pdf> for the list of namelist settings)

Schulz & Vogel: main changes

- improved bare soil evaporation
 - less evaporation for medium-wet to wet soil conditions, thereby leading to smaller Td2m and larger T2m values as well as to a larger diurnal temperature range
 - more evaporation for medium-dry to dry soil conditions, thereby leading to larger Td2m and smaller T2m values as well as to a smaller diurnal temperature range
- skin layer temperature (new; to simulate vegetation canopy effect)
- interception reservoir activated (new)
- a few more smaller changes; *still unsatisfactory: plant transpiration*

→ ***additionally needed for mitigation of poorly tuned model:***

→ ***artificially reduced evapotranspiration***

Operational configuration

Namelist settings recommended for **loldtur = .TRUE.** (see <http://www.cosmo-model.org/content/model/releases/cosmo-icon-physics.htm> **as well as by WG3b based on paper by Schulz & Vogel** (see <http://www.cosmo-model.org/content/tasks/workGroups/wg3b/docs/TERRAsettings.pdf>), *except for*

- **c_soil = 0.8** (instead of 1.0 **to decrease evaporation**)
Surface area density of the (evaporative) soil surface
- **RSMIN = min(RSMIN,150)*1.5** (**to decrease transpiration**; Istomata=.TRUE.)
External parameter field for the minimum stomata resistance of plants
- for 1.1km: **cimpl = 250** (instead of 150)
Stability parameter for the computation of the skin temperature
- for 1.1km: **SKC = max(SKC,40)** where **FR_LAND>0.5** (instead of $SKC \in [10., \dots]$)
External parameter field for skin conductivity

2m Dewpoint Spring 2020 (15d)

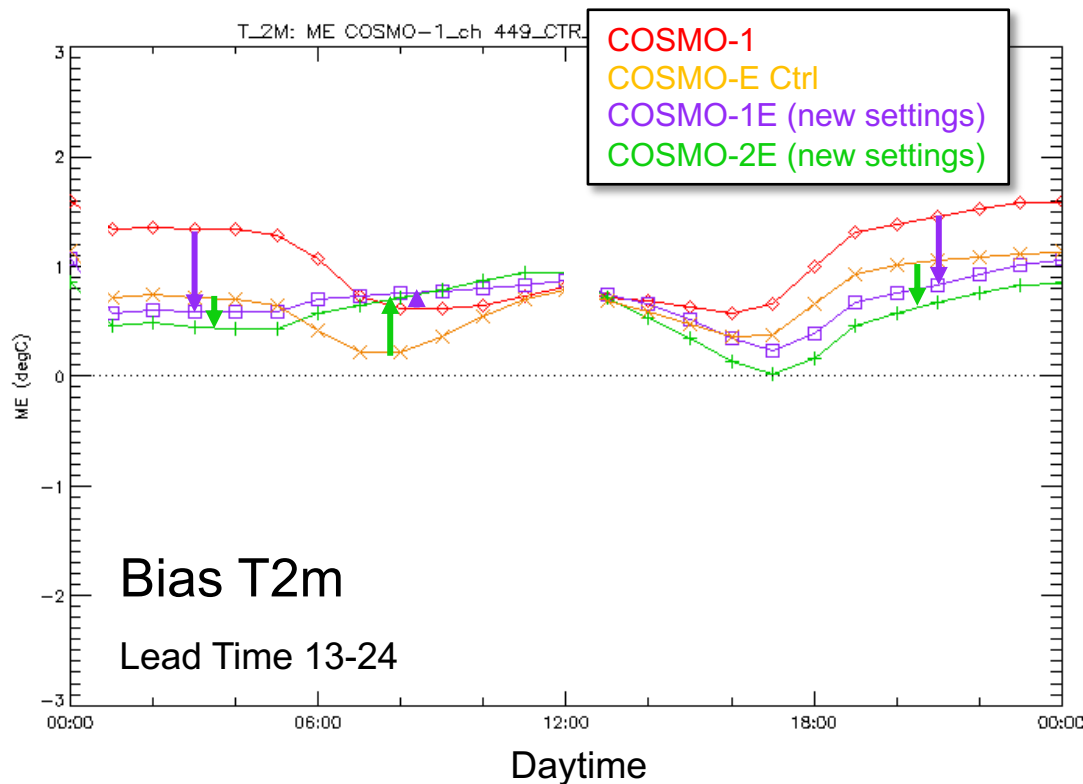

T_d bias almost
back to normal
(afternoon) or
even improved
(night, morning)

2m Temperature Summer 2019 (15d)

Considerably
smaller bias late
afternoon and
night ↓, some
degradation
during few
morning hours ↑

Cloudiness > 6.5 okta	Slightly worse	Slightly better	Similar
Gusts > 12.5 m/s	Slightly better	Much better	Worse

Not significant, only very few cases

Verification highlights

Higher resolution versus higher number of ensemble members – can the smaller COSMO-1E ensemble with 11 members beat the bigger COSMO-2E ensemble with 22 members?

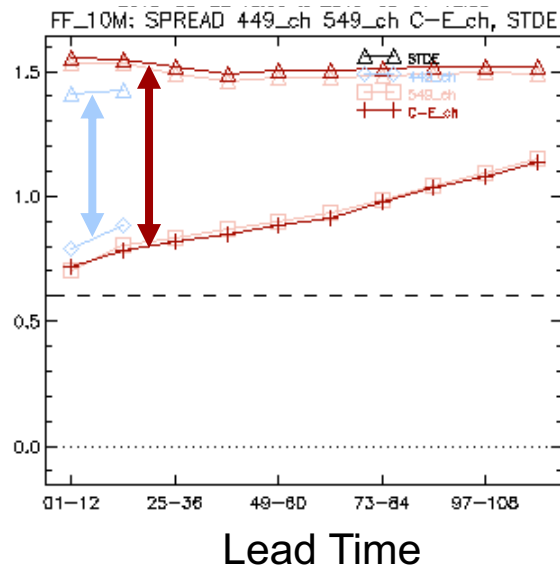

Spread / Error Relation

The spread/error relation
for the 1.1 km model
COSMO-1E is similar for
most parameters and
for some even better
than for the 2.2 km
models COSMO-2E and
COSMO-E

Example: wind speed,
summer 2019

△ COSMO-E Error
△ COSMO-2E Error
△ COSMO-1E Error
△ COSMO-1E Spread
□ COSMO-2E Spread
+ COSMO-E Spread

Ranked Probability Skill Score RPSS

The RPSS of
COSMO-1E is **better**
for most parameters
and most seasons

Example: RPSS T2m,
autumn 2019

COSMO-1E vs COSMO-(2)E probabilistic

T-003: 449 vs 549 and COSMO-E

Verification Summary

- COSMO-1E **better than** COSMO-2E and COSMO-E
- COSMO-2E **as good as** (profile) or **slightly better than** (surface) COSMO-E
- COSMO-1E CTRL at short lead times is **slightly better than** (profile) or **as good as** (surface) COSMO-1
- COSMO-1E CTRL at long lead times is **as good as** (profile) or **slightly better than** (surface) COSMO-1
