
Use of dace-observation-operators in ICON-KENDA

H. Reich, E. Bauernschubert, C. Schraff, H. Anlauf, R.
Potthast, S. Hollborn, M. Burba

ICCARUS KENDA Meeting, 10.03.2022

Outline

- ▶ Motivation
- ▶ Changes in dace-code and namelists
- ▶ Results from test experiments
- ▶ Summary, Outlook

Motivation

- ▶ up to now: COSMO-operators (implemented in dace-code) used for (KENDA-)MEC/ILAM
- ▶ unified code for observation operators for ICON global and ILAM (online/MEC)
- ▶ use of “local” cdfin-files from (DWD) data-base, QC similar to current KENDA setup, interpolation, grid point selection
- ▶ unification of operators started with AIREP, other observation system will follow
- ▶ relevant also for 4DEnVar (ILAM) (TL, adjoint)
- ▶ first application: “new” Mode-S Data, see Christoph’s talk

Changes in code and namelists

- ▶ committed to dace-dev and icon-master branch
- ▶ new namelist switch dace_obs_op: enables use of dace-operators for selected observation types
- ▶ list of dace-processed files necessary
- ▶ in &observations part of namelist:

```
read_cdfin    = T    ! read files for COSMO oper.  
read_netcdf   = T    ! read files for dace oper.  
obs_files     = 'cdfin_acars.nc' 'cdfin_amdar.nc'  
                'cdfin_modes.nc'  
dace_obs_op   = 'AIREP'
```

Changes in code and namelists

- ▶ temporal interpolation for dace-operators implemented (by Steffi Hollborn) to ensure 4D-LETKF
- ▶ blacklist check for dace-operators only for obs-types not processed with COSMO-Operators
- ▶ dace: bilinear interpolation used (horizontal); for Wind and Temperature spline-Interpolation (vertical). Can be changed by namelist to have similar settings as in COSMO

```
int_nn          = T  
vint_lin_t     = T  
vint_lin_uv    = T
```

further namelist/code changes (1)

- ▶ switch off obs close to boundary, near-surface-check as in COSMO:

```
&REPORT check = 'AREA'      use='forget' /
&REPORT type   = 'AIREP'    excl_bnd=0.2 /
&rules
  comment      = 'Exclude AIREPs near surface'
  obstype     = 2 ! obstype AIREP
  asurf       = 3 ! up to 10 hPa above surface
  use         = 'passive'
/
```

further namelist changes (2)

- ▶ flight phase check, roll angle check as in COSMO:

```
&AIREP_OBS
```

```
    chk_phase      = 0 ! (0) flight phase chk  
                           (1=reject unsteady)
```

```
    chk_rollangle = 3 ! (0) roll-angle check  
                           (1=reject bad, 2=require good,  
                           3=wind only)
```

```
/
```

code and namelist changes

- ▶ prethinning (before first-guess check) in MEC/ILAM
(mo_icon2dace.f90, mo_veri_obs.f90)
- ▶ only used for Mode-S currently

&THINNING

```
comment      = 'Mode-S'  
obstype     = 'AIREP'  
codetype   = 146 ! MODE-S  
d_km       = 40   ! ca 40 km  horizontal distance  
dlev        = 10   ! 10 hPa vertical distance  
state       = 'dismiss' ! dismiss observation  
pass        = 0    ! before fg-check  
/
```

- ▶ thinning for AMDAR has to be done in LETKF now
- ▶ still different to COSMO: redundancy-check, flight track check

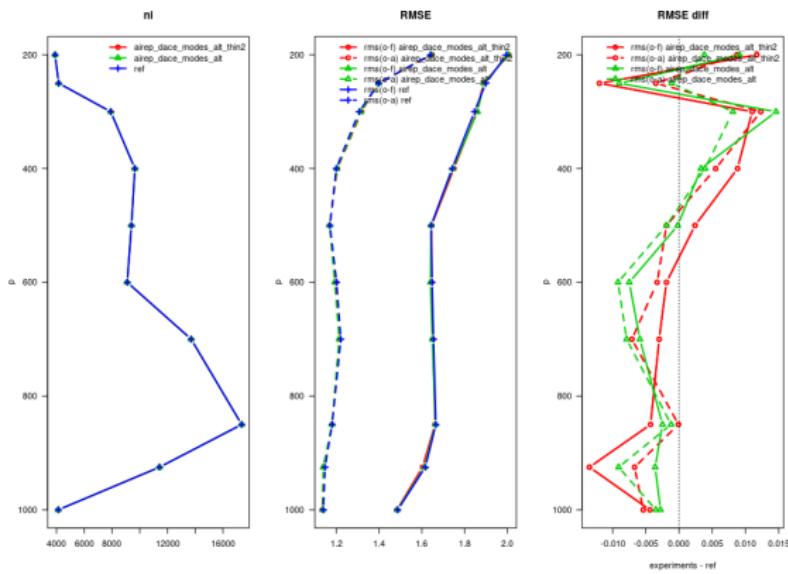

Experimental setup

- ▶ Experiments with ILAM-online to test dace-operators
- ▶ shown here: results from test-phase for new Mode-S data

```
ref      : COSMO Operators ("Routine-setup")
alt      : AIREP dace operators, "old" Mode-S data
alt_thin2: AIREP with dace operators; "old" Mode-S data;
           2-step thinning used for AMDAR
```

startdate: 20211001010000 enddate: 20211020030000

COSMO/dace AIREP Operators, Analysis-cycle, RMSE; **COSMO op.**,
dace op. 2step thin, **dace op**

Analysis cycle: scores for AIREP

Temperature statistics for AIREP
experiments: airep_dace_modes_alt_thin2, airep_dace_modes_all, ref
startdate: 20211001010000 enddate: 20211020030000

COSMO/dace AIREP Operators, Analysis-cycle, RMSE; **COSMO op., dace op. 2step thin, dace op.**

Thinning

- ▶ AIREP dace-Operators use less data below 500 hPa with thinning; larger RMSE
- ▶ different thinning compared to COSMO: spatial, not along flight track
- ▶ “2 step” thinning in LETKF

thinning namelist

```
&THINNING
    comment      = 'AMDAR'
    obstype     = 'AIREP'
    codetype    = 145          ! AMDAR
    d_km        = 40           ! 40 km horizontal distance
    dlev        = 10            ! 10 hPa vertical distance
    plevel      = 500 100       ! pressure level boundaries
    state        = 'passive'   ! set to passive
    rule1       = 'status'
    rule2       = 'data'

```

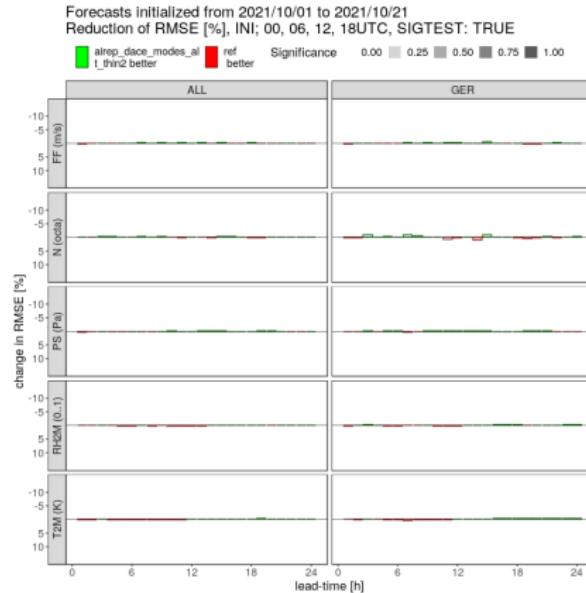

/

&THINNING

```
    d_km        = 20           ! 20 km horizontal distance
    dlev        = 5             ! 5 hPa vertical distance
    plevel     = 1050 500
```

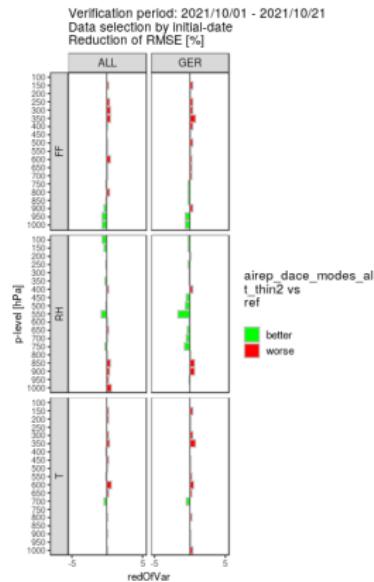

/

Forecast scores

SYNOP: COSMO op., dace op. 2step thin

Forecast scores

TEMP: COSMO op, dace op. 2step thin

Summary and Outlook

- ▶ use of dace-AIREP Operators for ILAM implemented
- ▶ similar results as with COSMO-Operators
- ▶ slightly increased RMSE for AIREPS below 500 hPa can be reduced by “2-step” thinning
- ▶ other observation systems follow (TEMP,SYNOP,...)
